13. ABSTRACT (Maximum 200 words)

Hydrocarbons are important contributors to formation of ozone and organic aerosols. Current sampling methods do not account for semi-volatile hydrocarbons (C10-C18 or higher) and their quantities relative to those typically sampled are not well known. This study determines >C10 hydrocarbon quantities and compares them to hydrocarbons determined using typical sampling methods at three locations in California with different predominant emission sources. Ambient air predominated by motor vehicle emissions, typical urban emissions, and oil production emissions were sampled at the Caldecott Tunnel near San Francisco, a site in Los Angeles, and a site in Oildale respectively. Whole air samples were collected using stainless steel canisters for C2-C12 hydrocarbons, and Tenax-TA solid adsorbents were used for collection of C8-C18 hydrocarbons. Hydrocarbon analysis was determined using high resolution gas chromatographic separation and Fourier transform infrared/mass spectrometric detection of flame ionization detection. Results showed that C10 to C18 hydrocarbons make-up from 6 to 18% of the C2 to C18 hydrocarbons and the C12 to C18 contribution is 1 to 7%. this indicates better characterization of hydrocarbons in ambient air should include sampling and analysis of up to C12 hydrocarbon species at a minimum.
