

CEFS/SCOS_WEB
Version Documentation and Update Chronology
(Version 2.0)

With the publishing of the South Coast "Draft" Ozone AQMP completed, this became a step-off point for the development of Version 2.0. The general inventory product description described in version 1.0 documentation (section 4.a) still applies. The Version 1.0 Update Chronology describes the updates made in the course of developing and using Version 1.0. The most recent updates to the forecast inputs comprising version 2.0 are documented below.

Notes:

1) Beginning with Version 2.0, each and every significant update to the SCOS web site will be indicated by a change to the Version ID along with a memo entry in this page that describes the update(s).

2) The version control for updates to the planning and modeling inventory projections are principally kept in sync. If inputs to the forecast model have changed, both planning and modeling projections are re-run to ensure that the planning and modeling inventory outputs reflect the same set of inputs. There is typically a lag time of a couple days between the dates posted for planning and modeling EI projections (either in their original posting or when updates occur) due to the CEFS longer run-time required for the modeling projections.

Planning Projections
