

**Impact Assessment Challenges with Emerging Fuels**

 **December 8, 2010**   
**Fuels Multimedia Evaluation**  
**Public meeting**

Dave Rice, Consultant to University of California  
Tom McKone, University of California, Berkeley  
Tim Ginn, University of California, Davis

 **New Uncertainties** 

---

- As we move away from petroleum based fuels toward fuels derived from cultured plants and animal products there are new types of uncertainties.
- Chemicals used to:
  - fertilize,
  - promote growth
  - Inhibit weeds and pests
- Anthropogenic chemicals in water
  - Brown/gray water used for fuel crops
  - Endocrine disruptors
- Animal diseases
  - Prions

---

 **Example: Round-Up** 

---

- **Glyphosate herbicide (Round-Up)**
  - Applied with surfactant
    - Polyethoxylated tallow amine (POEA)
    - Possible endocrine disruptor
    - Wildlife toxicity
- **Plants genetically engineered to tolerate Round-Up, e.g., soy, corn**
- **Little is known about fate of glyphosate during biofuels production and use.**

---

---

### Example: Prions

- **Ancient, tough organic life form?**
  - Mad-Cow, Creutzfeldt-Jakob (humans)
  - Impacts brain and neural tissue through ingestion
  - Incurable, fatal
- **Structural stability**
  - Resistant to denaturation by chemical or physical agents
  - 1N NaOH in autoclave for 30 minutes
- **Current protection is through inspection and control of high risk food material**
- **Little is know about fate of Prions during production and use of biofuels using tallow**
