Comment:

I congratulate CARB for recommending implementation of mandated energy standards, muscular energy efficiency measures, and clean vehicle requirements.

However, CARB must go farther if we are going to make the major changes needed to prevent catastrophic changes to our climate. Please include in your Final Scoping Plan steps to

- Reduce vehicle miles traveled
- Speed up production of zero-emission vehicles
- Boost recycling rates
- Auction off any emissions permits
- Limit offsets
- Minimize air quality impacts in our most-polluted communities.

Thank you very much for all your hard work.

Subject: Deminimus Thresholds

Comment:

The deminimus thresholds should be on truly minor issues. Your example of a computer duster is not minor and is easily taxed. The 800 pounds of GWP emitted at an estimated \$10/ton CO2E means that can would produce \$4 in tax revenue. The distributor of the can is selling thousands so it is easily intercepted. There is also the societal benefit that children cannot inhale them and die as dozens do each year.

A deminimus emission would be the VOC from an underarm deodorant stick. Even a truck load would have lower VOC emissions than the untreated underarms.

Subject: Comments on Scoping Plan

Comment:

The Climate Change Draft Scoping plan requested public comment. I am submitting my suggestions, But first I believe we should review where we are, how we got here, and where we need to go.

To see how we got here and where we are we need to go back about a hundred year s. Several factors gave the nod to internal combustion engines over electric vehicles. Improved roads lead to the demand for more range than could be obtained by electric vehicles at that time. An electric starter made it possible for ladies to drive the cars. The abundance of petroleum provided a cheap source of fuel. The petroleum industry and the auto industry helped make our country the great world leader it is today. The success of these industries in the past has trapped us into thinking that this is the correct course to take in the future. Nothing could be further from the truth. The petroleum is neither inexpensive nor available locally. The IC engine uses only 15% of the energy available for propulsion. The rest goes of as heat. The sheer numbers of the vehicles has created an unacceptable pollution problem. Our present policies are setup to perpetuate the status quo. Presently, the most highly subsidized entity is the petroleum industry. The intention of a subsidy is to give aid to an infant industry so it can get on its feet. Instead, our money is going to the most profitable of industries, helping them to maintain a monopoly and keep out competitive industries. This is the exact reverse of what a subsidy should be used for. With the above thoughts in mind, here are my suggestions.

Renewable energy infrastructure is needed. The governor has made

progress
in providing for the installation of hydrogen stations. The
stations should
also be a source of all forms of nonpolluting renewable energy-
ethanol,
biodiesel etc.

The drivers should have the option of supporting Arab millionaires
and
contributing to pollution or helping American farmers and helping
to clean
the air.

A system has been developed for improving the performance of heavy
equipment
and trucks by XOP, Inc. The system electrolyzes water and the
Hydrogen and
Oxygen is added to the intake of the engine. The system improves
the
mileage, and greatly reduces all pollutants. It has been approved
by CARB.
Web site www.h2xop.com <<http://www.h2xop.com/>> A similar system
small
enough to fit in an automobile needs to be designed.

SOLAR

The fastest return on an investment in solar energy is in solar
water
heating, and tax credits are available. (1)In the 1920's fifty
percent of
the homes in Florida heated their water with solar energy. Then
they started
running in natural gas lines and the price was so reasonable that
the solar
units disappeared. Today, with the high price of natural gas, you
can save
money with the solar heaters.

Photovoltaic (PV) panels have a bright future. One of the great
contributions of this type of energy is that it can be installed
locally,
where it is needed. It is distributed energy. It requires no
additional
electric lines and there is no line loss involved. Most other
forms of
energy including wind systems are located remotely from where the
energy is
needed. The lines and the systems are vulnerable to natural
disasters and to
terrorists. The PV panels are a CGS system, clean, no particle
pollution,
green, no air pollution and serene, no noise pollution. There is
one more
important characteristic of these panels. They produce the most
electricity
right when there is a peak demand. Enough of these units on line
would be a
great buffer to black outs. But here is where our polices
interfere with
progress. There was a cap on the number of PV units that will be
subsidized
at 1.5% in California. It is interesting to note that the energy

source with
the greatest potential is the one we are using the least. De
Winter and
Swenson (2) place the technically feasible energy from PV at 60
terawatts. A
terawatt is one million megawatts. The world energy consumption in
2005 was
17 terawatts

Turning Trash into Cash (TIC)

One of the emerging technologies that Barry Hanson has disclosed
in his book
"Energy Power Shift" is the possibility of turning garbage into
oil (3). The
process heats the waste material to a high temperature in the
absence of
oxygen, Pyrolysis. It does in hours what it took Mother Nature a
millennium
to do.

This is a win, win, situation. It produces a source of oil for all
of us
while eliminating tons of trash going into land fills where it
produces
methane gas.

.

Mr. Hanson has pointed out that if we open up the Artic National
Wildlife
Reserve, after ten years the total amount of energy available will
be 14
Quads (we currently use 27 Quads in one year in the USA) The
temperature
conversion process can provide us with 120 Quads before one drop
of oil can
be pumped from the ANWR.

For those who think a switch to alternative energy would cost too
much
money, Barry Hanson has summarized the benefits as:

6.5 million new jobs
Clean environment
Energy independence
True national security
Sources.

Subject: Re: A Solar Solution To California's Water Shortages
Comment:

California Air Resources Board
ARB Board of Directors
Mary D. Nichols
Chairwoman

July 17, 2008

Dear Chairwoman Nichols, ARB Board of Directors & Staff,

Thanks for your many good works, your strong environmental stand is much appreciated. Here in California, we are told that the snow packs on our mountain tops are shrinking. There's less and less fresh water to share between our growing populations, farmers, ranchers and wildlife. Water is life.

The following article alerted me to the problem concerning the oil fired, natural gas, coal and nuclear power plants. They all use copious amounts of our nation's fresh water resource.

<http://planetsave.com/blog/2008/01/23/water-shortage-could-dry-up-nuclear-power-plants-in-southeast/>

Headline: U.S. WANTS TO CUT POWER PLANT WATER USAGE

Wed, 18 Jul 2007 20:32:16 GMT
Science Technology News
Author: Science News Editor

WASHINGTON, U.S. Department of Energy officials said thermoelectric power plants using coal, oil, natural gas and nuclear sources require significant amounts of water for cooling and are a major competitor for water resources. A 2000 study found electric power plants were the second largest U.S. user of fresh water, withdrawing 136 billion gallons of fresh water daily. Only agriculture used more water.

Energy Department officials said the goal is to achieve a "50 percent" reduction in power plant fresh water usage by 2015.

Copyright 2007 by UPI

The full article:

<http://www.earthtimes.org/articles/show/84367.html>

Solar electric roof shingles and solar electric panels use "no" water in the generation of clean renewable electricity. They have no moving parts, make no noise, cause no chemical reaction, require virtually no maintenance and are guaranteed on average for 25 years.

When one factors in the true cost of generating electricity including the use of water as well as the production of greenhouse gases and other toxic emissions, solar electricity leads the field with clean, low cost, renewable energy.

Governor Schwarzenegger has recently told us that due to climate destabilization, forest fires aren't just seasonal anymore, they're year round. This will add new competition for our already strained precious water resources.

California can improve its flexibility to cope with an uncertain water future by working to seriously reduce demand while practicing environmental stewardship.

Comment 5 for High GWP Comments for the GHG Scoping Plan (sp-highgwp-ws) - 1st Workshop.

First Name: Kate

Last Name: Bailey

Email Address: kate@ecocycle.org

Affiliation: Eco-Cycle, Boulder, CO

Subject: GWP over the short term or 20-year period

Comment:

Global warming potential is measured by the IPCC over three time periods: 20, 100 and 500 years. While Kyoto policymakers set the current standard for calculating emissions over the 100 year impact, the IPCC states the choice of time period is a policy decision, not a scientific one. The attached document speaks more to the background of why GHG emissions can be evaluated over any of these three timelines and why the 20-year timeline is essential to moving climate solutions forward.

I urge the California Air Resources Board to consider both the 100 and 20 year time periods in your GHG calculations. This means recalculating only the non-CO2 emissions in your inventory since CO2 emissions are normalized as 1 across all time periods. The benefits of this approach are tremendous. We have little time to make substantial changes across all sectors of our economy. Short term reductions of potent GHG emissions will essentially buy us precious time to make the longer term reductions needed in CO2 emissions from transportation and energy use. These reductions offer more "bang for the buck" at a time when every penny counts.

Paramount to short term emission reductions is eliminating methane releases from landfills. A commitment to ending the practice of sending organic materials - yard trimmings, food scraps and paper products - to landfills will eliminate potent methane emissions. Methane is 72 times more potent than CO2 over a 20-year time period, and will comprise a much larger percentage of overall GHG emissions when evaluated over the short term. Again, looking at the whole picture through a short and long term scope gives a more accurate view of what is needed to move us forward, quickly and efficiently.

Investing in composting infrastructure to keep these organic materials out of landfills will also yield carbon storage benefits. Soil is one of our largest carbon stores, yet we have rapidly depleted its carbon content over the past 150 years of industrialized farming. Soil holds more carbon than the atmosphere or biomass (see www.cool2012.org) and replenishing soil carbon stocks by applying compost from otherwise landfilled organic materials is a no-brainer climate solution.

This opportunity to achieve substantial emission reductions in the near term is a must for local and national climate strategies. I urge California to be a leader in evaluating both the short and long term impacts of our GHG emissions and implementing strategies

to address both needs.

Comment:

Reducing greenhouse gases is highest priority for the planet!

Make polluters pay for their emissions of greenhouse gases, using the resulting revenues to promote clean energy and aid low-income consumers. Limit sharply and verify any offsets. Do not link our program to any states with weaker emission standards.

Subject: Livestock sector is a major greenhouse gas source

Comment:

I was excited for your fast response on the hot issue of global warming, and encouraged by your efforts.

I would suggest adding a livestock sector as one of the greenhouse gas sources. According to Senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld, "Livestock are one of the most significant contributors to today's most serious environmental problems ...", and "Urgent action is required to remedy the situation." The reasons include:

1. " ...the livestock sector generates more greenhouse gas emissions as measured in CO2 equivalent - 18 percent - than transport. It is also a major source of land and water degradation."

2. "It generates 65 percent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure. And it accounts for respectively 37 percent of all human-induced methane (23 times as warming as CO2), which is largely produced by the digestive system of ruminants, and 64 percent of ammonia, which contributes significantly to acid rain."

3. "Livestock now use 30 percent of the earth's entire land surface, mostly permanent pasture but also including 33 percent of the global arable land used to producing feed for livestock, the report notes. As forests are cleared to create new pastures, it is a major driver of deforestation, especially in Latin America where, for example, some 70 percent of former forests in the Amazon have been turned over to grazing."

4. "The livestock business is among the most damaging sectors to the earth's increasingly scarce water resources, contributing among other things to water pollution, eutrophication and the degeneration of coral reefs. The major polluting agents are animal wastes, antibiotics and hormones, chemicals from tanneries, fertilizers and the pesticides used to spray feed crops. Widespread overgrazing disturbs water cycles, reducing replenishment of above and below ground water resources. Significant amounts of water are withdrawn for the production of feed."

For more detail information about livestock, please click the link www.fao.org/newsroom/en/news/2006/1000448.

Livestock sector is a major greenhouse gas source. Please do not ignore it. Thanks for your attention.

Subject: vegetarian diet is the way to reduce greenhouse gas

Comment:

We should stop to raising animals, stop to kill them, and stop to eat their meats for our health and save the planet.

According Food and agriculture Organization of United Nation, livestock is a major threat to environment. Livestock generates 65 percent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO₂. Most of this comes from manure. And it accounts for respectively 37 percent of all human-induced methane (23 times as warming as CO₂), which is largely produced by the digestive system of ruminants, and 64 percent of ammonia, which contributes significantly to acid rain.

Livestock use 30 percent of the earth's entire land surface, mostly permanent pasture but also including 33 percent of the global arable land used to producing feed for livestock, the report notes. As forests are cleared to create new pastures, it is a major driver of deforestation, especially in Latin America where, for example, some 70 percent of former forests in the Amazon have been turned over to grazing. For more information, please refer to these websites:
<http://www.ecofoodprint.org/climate.html>
<http://www.fao.org/newsroom/en/news/2006/1000448/index.html>

Eating meats cause a lot of diseases, such as cancer, heart disease, mad cow disease, bird flu, etc., while vegetarian diet is safe, health, and economic. Vegetarian kids have higher IQs than their classmates; vegetarians live, on average, six to ten years longer than meat-eaters; fifty percent less likely to develop heart disease and cancer. Subject: Subject: Livestock is a major reason of global warming

Comment:

Comment:

It is great to know that you as a government officials take the initiative to act on this issue of global warming, I was encouraged by you and appreciated your great effort. That's the government that we people need.

After went through your plan, I have found out a big loop hole in the whole act, that is you missed the big picture of the whole issue: the main reason to cause the global warming. If you check all the publication from Nasa Website, Many scientist have already proved that the most contribution of the global warming is from live stock industry, meat eating of us is the real reason behind it. Only if we know about the truth, then we can find the right way to solve the problems. Vegetarianism is the best way to stop the global warming.

According to Senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld, livestock are one of the most significant contributors to today's most serious environmental problems and urgent action is required to remedy the situation.? The reasons include:

1. The livestock sector generates more greenhouse gas emissions as measured in CO2 equivalent to 18 percent than transport. It is also a major source of land and water degradation.

2. Livestock generates 65 percent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure. And it accounts for respectively 37 percent of all human-induced methane (23 times as warming as CO2), which is largely produced by the digestive system of ruminants, and 64 percent of ammonia, which contributes significantly to acid rain.

3. livestock now use 30 percent of the earth entire land surface, mostly permanent pasture but also including 33 percent of the global arable land used to producing feed for livestock, the report notes. As forests are cleared to create new pastures, it is a major driver of deforestation, especially in Latin America where, for example, some 70 percent of former forests in the

Amazon
have been turned over to grazing.

4. The livestock business is among the most damaging sectors to the earth increasingly scarce water resources, contributing among other things to water pollution, eutrophication and the degeneration of coral reefs. The major polluting agents are animal wastes, antibiotics and hormones, chemicals from tanneries, fertilizers and the pesticides used to spray feed crops. Widespread overgrazing disturbs water cycles, reducing replenishment of above and below ground water resources. Significant amounts of water are withdrawn for the production of feed.

For more detail information about livestock, please click the below link: www.fao.org/newsroom/en/news/2006/1000448.

Livestock sector is a major greenhouse gas source. Please do not ignore it. Only vegetarianism can solve the Crisis. Otherwise, by 2012, the world is going to the point of no return. Human species is going to vanish from the earth including all other living beings. So please add this most important part into your sector or as a general background of this act.

Thanks for your understanding and acceptance of our suggestions

Zheng Liang
