of each compliance year to establish fleets? Will this be part of the online Freight Regulations Reporting System (“FRRS”) mentioned in the presentation from the May 14, 2019 and May 16, 2019 public workshops?

Port staff request an initial accommodation for new fleets entering the California market. New entrants should be given an opportunity to estimate the coming year’s ship calls and estimate the number of VIEs to be awarded for the coming year.

The definition of Fleet and the requirements for VIEs also need to be responsive to changes in the shipping industry, for example when businesses merge or alliances change. Likewise, CARB should clarify what provisions will accommodate changes in the terminal industry, such as new terminals or changes in ownership, in the allocation of TIEs.

4. Port staff have two comments regarding vessel commissioning. Port staff request that vessel commissioning events that do not successfully connect to shore power as discussed in Section 93130.7(f)(2) of the Proposed Control Measure be considered eligible for exceptions under the regulation. The commissioning attempt shows that the goal was to reduce emissions through shore power and as such an Exception should be available to operators in this situation. Port staff conduct each vessel commissioning (with the exception of those at the Matson Terminal) to ensure the safety of the vessel, terminal, and workforce. Vessel commissioning is an invaluable safety procedure and should not be penalized under the Proposed Control Measure.

Port staff request that the definition of “Vessel Commissioning” in Section 93130.2(b)(61) of the Proposed Control Measure be expanded to include the case in which the port authority is the commissioning agent, as is the case at the Port of Oakland. Likewise, in Section 93130.7(d)(1) (“If applicable, commission vessel as required by terminal operator”), Section 93130.8(a)(4) (“It is the terminal operator’s responsibility to commission vessels equipped with shore power”), and Section 93130.8(d)(1) (“If applicable, commission vessel for use of shore power”), the commissioning requirement should be determined by the port authority or the terminal operator.

5. The reduction in VIEs and TIEs for Container, Reefer, and Passenger vessels from 5% each to 3% each discussed in Sections 93130.7(g)(1)(A)(ii) and 93130.8(h)(1)(A)(ii) of the Proposed Control Measure serves to increase the usage of the Remediation Fund [Section 93130.12(a)] in and after 2023. Port staff request further information from CARB on when and where the Remediation Fund will be deployed, given that CARB anticipates zero-emissions regulation on trucks, transport refrigeration units, forklifts, and cargo-handling equipment in the time frame of enhanced usage of the Remediation Fund, making those categories ineligible for incentive-funded emissions reductions.

6. The allotted VIEs and TIEs for vessels other than Container, Reefer, and Passenger vessels in Sections 93130.7(g)(1)(A) and 93130.8(h)(1)(A) of the Proposed Control Measure reduce from 5% to 3% after only one year. Port staff note that at the advent of the ATCM, the requirement was 50% of all calls in the first year. An initial expectation of 90% usage does not accommodate the fact that the Proposed Control Measure is the first-of-its-kind requirement for Ro-Ro and Tanker vessels in the world, and the technologies and equipment required do not exist at this time and have not been tested.
7. Regarding the Remediation Fund described in Section 93130.12 of the Proposed Control Measure, what is the procedure and timeline for CARB to approve a public entity to manage the funds generated at the Port?
8. Port staff request clarification from CARB of what constitutes a failure to achieve “full emission reductions” as referenced in Section 93130.12(a)(3) of the Proposed Control Measure, regarding when the Remediation Fund may be used.
9. In response to the suggestion in Section 93130.8(a)(2) of the Proposed Control Measure that a terminal operator should be responsible to interrupt a vessel call to shift the vessel to a berth with shore power if no berth was previously available, Port staff request CARB prepare and share an analysis of harbor craft emissions associated with such a shift at each port. Second to OGV, harbor craft are the second-highest emitting sources of emissions in the Port’s 2017 Emissions Inventory. Given the short duration of the average vessel call to the Port, the suggestion to call additional harbor craft to reduce the remaining hours of an OGV call’s auxiliary emissions could lead to increased overall emissions.
10. Likewise, Port staff question if the suggestion in Section 93130.8(a)(3) of the Proposed Control Measure that a terminal operator should be responsible to provide an alternative CARB-approved emission control strategy if a commissioned shore power vessel is berthed such that it cannot connect to shore power is necessary. CARB’s own analysis in the Cost Inputs and Assumptions in PDF format, Table XI, declares that no barge-based capture and control system is anticipated for the Port.
11. Port staff note that the “power meter readings at the time of shore power connection and disconnection” requested in Section 93130.8(e)(2)(C) of the Proposed Control Measure are typically not available within 7 calendar days of a vessel’s departure, as anticipated by CARB. Power meter readings at the Port are typically available at the close of the calendar month and not sooner.
12. In Section 93130.1 of the Proposed Control Measure, the stated intent of the Proposed Control Measure is “to ensure that operators of ocean-going vessels reduce emissions using a California Air Resources Board (CARB) approved emission control strategy to reduce PM, NOx, and ROG emissions at berth without increasing overall GHG emissions from this Control Measure...” How will CARB monitor GHG emissions after

implementation of the Proposed Control Measure and what is the GHG emissions baseline?

### **Comments and Questions on the presentation from the May 14, 2019 and May 16, 2019 public workshops**

13. On Slide 4 of the presentation for the May 14, 2019 and May 16, 2019, public workshops, CARB staff show OGV at-berth emissions for the entire state. Port staff request to see these emissions totals further tabulated both by port or marine terminal and by vessel type. This is especially important as, per Section 93130.7(g)(2) of the Proposed Control Measure, VIEs are specific to the Fleet-Port pairing they are granted to.
14. On Slides 5 and 29 of the presentation for the May 14, 2019 and May 16, 2019 public workshops, CARB staff show a table of cost effectiveness for this rulemaking. The Port provides specific comments on the cost estimates below. Port staff request to see the total cost estimates and cost effectiveness estimates further tabulated both by port and by vessel type.

### **Comments and Questions on the Cost Inputs and Assumptions in PDF format**

15. In Table V. Auxiliary Engine Effective Power Values, CARB states that it is relying on “the same power values cited in Table 7 of the emission inventory methodology <https://ww3.arb.ca.gov/msei/ordiesel/draft2019ogvinv.pdf>. Values used in cost analysis for container/reefer and tanker vessels are calculated as one kW-average per vessel type, weighted by average vessel kW at each port/terminal and vessel visits to each port/terminal.”

As noted in the Port’s February 15, 2019 letter to CARB regarding the emissions inventory, the emissions inventory relies on the assumption that container vessel effective power is a function of vessel size bin. Will this assumption in the emissions inventory be modified to align with the cost estimate?

16. In Table VI. Duration of Emission Control at Berth, CARB shows that it is estimating statewide emissions reductions based on average duration of emission control at berth per vessel visit. The Port requests an emissions and cost analysis specific to each port or marine terminal and each vessel type. The stated average Container/Reefer duration of emission control at berth of 38.8 hours is about twice the average time for shore power connections at the Port. The difference between Port data and the average shows that the statewide average is not meaningful for the Port, and the conclusions of the averaging analysis may not apply to the Port.
17. Table VIII. Electricity and Fuel Cost Inputs and the associated Cost Estimates in Excel format show that CARB expects 100% of any Low Carbon Fuel Standard (“LCFS”) credits would be reinvested into shore power. It is not guaranteed that the credits would

all be reinvested into shore power. What assumptions did CARB staff make in projecting the LCFS credit value through 2032?

18. Related to the duration of emission control at berth in Table VI, Port staff would like to reiterate that shore power usage at the Port is billed based on hours of use, not kWh drawn. This affects the assumptions in Table VIII. Electricity and Fuel Cost Inputs, as well. While the cost of Pacific Gas & Electric electricity is relevant to the Matson Terminal and the overall discussion of electricity costs, the Port is the utility serving shore power at all but the Matson Terminal.
19. The growth assumptions in Table IX. Growth Factors overestimate actual TEU growth for the Port between 2016 and 2018 and continue to use a 3.9% compound annual TEU growth rate between 2018 and 2032. Port staff request that in addition to this high estimate of TEU growth, CARB prepare an estimate of emissions using a realistic growth estimate. For reference, the Port's CAGR between 2008 and 2018 was 0.4%. Port staff understand that the growth estimates CARB is using for emissions and costs for the Port will align with the vessel fleet projections (such as larger vessels each year) that are being used for the Ports of Long Beach and Los Angeles.
20. Port staff note that the cost of compliance with the existing At-Berth Regulation is high and requires frequent vessel retrofits. In 2018, the Port commissioned or re-commissioned nearly 100 vessels, or about 25% of the ever-commissioned vessel list. The ongoing costs of retrofitting vessels when the line rotation changes, maintaining vessel equipment, and commissioning vessels with the current At-Berth Regulation apply equally to comply with the Proposed Control Measure and should be included in the cost estimates as they are real and necessary costs of compliance with the Proposed Control Measure. The Proposed Control Measure is not additive and incremental to the At-Berth Regulation, but rather a replacement and as such the entire cost to comply with the Proposed Control Measure needs to be factored into the cost effectiveness.

## **Closing**

Port staff appreciate the opportunity to review the Proposed Control Measure and attend the public workshop on May 14, 2019. We look forward to working with CARB on refinements to improve the Proposed Control Measure, emissions inventory, and associated analyses.

Please contact Catherine Mukai, P.E., Port Associate Environmental Planner/Scientist at [cmukai@portoakland.com](mailto:cmukai@portoakland.com) with any follow-up questions.

Sincerely,

Colleen Liang, Port Environmental Supervisor, for

Subject: Comments on *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* for the Proposed Control Measure for Ocean-Going Vessels At Berth and At Anchor

Dear Ms. Csondes:

The Port of Oakland (“Port”) appreciates the opportunity to comment on the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* posted January 15, 2019, for the Proposed Control Measure for Ocean-Going Vessels At Berth and At Anchor (“Proposed Control Measure”). The Port understands that the California Air Resources Board (“CARB”) is planning for the Proposed Control Measure to replace the current Airborne Toxic Control Measure (“ATCM”) for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (the “At-Berth Regulation”), with the goal of taking the Proposed Control Measure to the CARB Governing Board in December 2019. CARB posted the text of the Proposed Control Measure on August 31, 2018. The *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* was prepared in support of the Proposed Control Measure.

The Port supports CARB’s ongoing efforts to reduce emissions from ocean-going vessels (“OGVs”) at berth and is working diligently to maximize the number of vessel visits using shore power. Port staff work collaboratively with shipping lines to provide education and resources about the shore power program. Port staff also track shore power usage in real time, collecting detailed information from marine terminal operators and posting that information on the Port’s website for public information purposes.<sup>1</sup>

---

<sup>1</sup> <https://www.oaklandseaport.com/development-programs/shore-power/>

The *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* document includes emissions from California ports and CARB-defined Marine Terminal Complexes (“MTCs”). The emissions for 2016 are tabulated in Appendix B, while emissions for other years are only represented graphically in figures in the document and in tables published by CARB on November 9, 2018.

Comments on the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* are due to CARB February 15, 2019. CARB will then host a public workshop to discuss the emissions on February 26, 2019. After that, Port staff anticipate the need for a revised emissions inventory for the Proposed Control Measure that responds to public comments. The Port provides wharfinger information to CARB annually as required by grant funding obligations. In addition, Port staff request that CARB staff work with the Port to refine assumptions made in the emissions estimates.

Given the scheduling of the public workshop after the public comment period has closed, this letter includes comments and questions that may best be addressed in the workshop. Thus, the Port is providing a list of comments and questions on the draft emissions inventory and topics for discussion at the February 26 public workshop.

**Comments and Questions on the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results***

1. Why was 2016 selected as the baseline calendar year for the emissions inventory? Does CARB plan to conduct in-depth emissions inventories for 2017 and 2018?
2. Table 4 of the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* shows vessel visit counts to California ports and MTCs in 2016 only. However, current trends are for fewer calls by larger vessels for a given amount of containerized cargo. The discussion on page 25 of the draft clarifies that “vessel practice changes” are not considered, even as the total number of calls is dropping in real time. Since 2013, total annual calls to the Port have been decreasing. Container cargo throughput is thus decoupled from vessel call activity. CARB should expand the vessel growth forecasting for the baseline scenario to include the effects of larger vessels and fewer calls for the same amount of containerized cargo.
3. Table 7 of the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* relies on the assumption that for all ports and MTCs, container vessel effective power will match that of the Ports of Los Angeles and Long Beach in 2016. The effective power does not appear to be a function of vessel size bin, so the level of detail with which the effective power is classified by CARB-defined size bin is not appropriate. In addition, given the variation between data from the Port of Los Angeles and the Port of Long Beach within the same CARB-defined size bin, the data may not be meaningful when averaged by CARB-defined size bin. CARB should use an average effective power for container vessels regardless of size.

4. The growth rates in the Freight Analysis Framework (“FAF”) for ports and MTCs outside of the San Pedro Bay are at odds with current trends. The FAF assumption for container cargo at the Port of Oakland is a 5% year-over-year growth rate between 2016 and 2020. Actual growth rates between 2016 and 2018 have not kept pace, with current Oakland planning documents estimating about half the FAF compound annual growth rate.<sup>2</sup> CARB should adjust the FAF growth forecasting for the baseline scenario to align with actual trends.
5. Page 27 of the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* discusses statistical significance in the context of the emission forecasting. If CARB staff have conducted an uncertainties analysis, it should be included in the methodology and results document.
6. Table 15 of the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* does not treat all ports and vessel types equally when assuming “Projected 2020 and Later Time on Shorepower,” without justifying the differences. For instance, CARB assumes container vessels at the Port of Hueneme spend 80% of their time on shore power after 2020, while CARB assumes at the Ports of Los Angeles and Long Beach container vessels spend only 65% of their time on shore power. Impossibly, CARB-defined size bins 7, 9, and 12 container vessels at the Port of Oakland are assumed to spend 100% of their time at berth on shore power.<sup>3</sup> Port staff request further justification for and synchronization of the assumptions for “Projected 2020 and Later Time on Shorepower.”
7. In the discussion of the “static age distribution model” versus a survival and turnover model, CARB staff do not consider the abnormally high number of OGV keels laid in 2015. How did CARB decide that the spike in keels laid in 2015 was not material to estimating NOx emissions through 2050?
8. CARB should revise its assumption that sulfur content in fuel is 0.1% based on the results of enforcement analyses of in-use fuel sulfur. The sulfur content of in-use fuel as sampled by the CARB enforcement team in calendar years 2017 and 2018 is lower than 0.1% by 30% and almost 50%, respectively, presenting information that actual emissions are lower than those estimated by CARB. (As stated on page 12, information from CARB’s enforcement team is already used to determine reduced emissions from reduced engine activity time.)

---

<sup>2</sup> <https://www.portofoakland.com/community/environmental-stewardship/maritime-air-quality-improvement-plan/>

<sup>3</sup> Vessels arriving at berth need time to tie lines and lower gangways before they can connect shore power and likewise vessels need time to disconnect from shore power when leaving the berth. With these bookends on each vessel call, a vessel cannot be plugged into shore power for 100% of the time at berth.

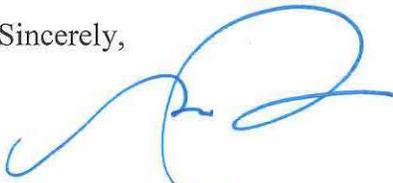

9. CARB should elaborate in the text on the Particulate Matter (“PM”) emission factor for Marine Gas Oil (“MGO”) at 0.1% sulfur. The 2007 Initial Statement of Reasons for At-Berth Regulation rulemaking used a value of 0.25 g/kW-hr for 0.1% S MGO. The *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* uses a PM emission factor of 0.18 g/kW-hr for the same fuel. The root source for OGV auxiliary engine emission factors is stated in both cases as the 2002 Entec study, with no description of why two different values of PM emission factors are used for the same fuel.
10. Please add References to the Table of Contents and to the document (Sources of emission factor information are only included at the end of Appendix A).
11. On page 42, should the last sentence read “it excludes emissions from boilers,” not “it excludes emissions from auxiliary engines”?

### Closing

Port staff look forward to working with CARB to support the updated emissions inventories referred to in the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* after the workshop on February 26.

Please contact Catherine Mukai, P.E., Port Associate Environmental Planner/Scientist at [cmukai@portoakland.com](mailto:cmukai@portoakland.com) with any follow-up questions.

Subject: Comments on Preliminary Draft Health Risk Assessment (“HRA”) for the Proposed Control Measure for Ocean-Going Vessels At Berth and At Anchor

Dear Ms. Csondes:

The Port of Oakland (“Port”) appreciates the opportunity to comment on the Preliminary Draft HRA posted November 5, 2018, for the Proposed Control Measure for Ocean-Going Vessels At Berth and At Anchor (“Proposed Control Measure”). The Port understands that the California Air Resources Board (“CARB”) is planning for the Proposed Control Measure to replace the current Airborne Toxic Control Measure (“ATCM”) for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (the “At-Berth Regulation”), with the goal of taking the Proposed Control Measure to the CARB Governing Board in December 2019. CARB posted the text of the Proposed Control Measure on August 31, 2018. The November 5, 2018, Preliminary Draft HRA and associated air dispersion modeling files that CARB released December 14, 2018, were prepared in support of the Proposed Control Measure.

The Preliminary Health Analyses document contains two types of assessment, 1) an HRA using air dispersion modeling and impacts estimation guidance from the California Environmental Protection Agency Office of Environmental Health Hazard Assessment (“OEHHA”) and 2) an Incidents per Ton (“IPT”) analysis.

The Port supports CARB’s ongoing efforts to reduce emissions from ocean-going vessels (“OGV”) at berth and is working diligently to maximize the number of vessel visits using shore power. Port staff work collaboratively with shipping lines to provide education and resources about the shore power program. Port staff also track shore power usage in real time, collecting

detailed information from marine terminal operators and posting that information on the Port's web site for public information purposes.<sup>1</sup>

**The key input to the Preliminary Draft HRA is the estimated emissions from vessels at berth, which are not yet final. Emissions estimates need to be final and the Preliminary Draft HRA updated before the Preliminary Draft HRA results can be used.**

CARB conducted two HRAs addressing only the Ports of Long Beach and Los Angeles together and the Richmond Complex. CARB's use of AERMOD and the 2015 OEHHA Risk Assessment Guidelines for HRAs represents current best practices. However, the robustness of the findings is limited by the emissions estimates. Emissions estimates are typically completed before the HRA but in this case are open for public comment and discussion through the end of February 2019, at which point they may be refined.

The air dispersion model AERMOD, which CARB selected for the Preliminary Draft HRA is the preferred model from the US Environmental Protection Agency. Required inputs to AERMOD include meteorological data, emissions information for each pollutant considered, and exhaust parameters for release points. Of these inputs, the estimated emissions are key, since emissions have a direct linear relationship with the estimated ambient concentrations and health impacts from each source.

On November 5, 2018, CARB posted the Preliminary Draft HRA. CARB then posted a hard-coded spreadsheet of "Draft At Berth Emissions Estimates" used in the Preliminary Draft HRA on November 9, 2018, and air dispersion modeling files in mid-December with a public comment period for the Preliminary Draft HRA closing January 31, 2019.

CARB also posted the "Draft: 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results"—for the emissions that were entered into the Preliminary Draft HRA—on January 16, 2019, with a separate public comment period for the emissions methodology and results closing February 16, 2019.

Without greater understanding of the emissions used as data inputs to the air dispersion model and risk estimation calculations, the utility of the Preliminary Draft HRA is limited. Port staff are reviewing the emissions methodology released on January 16, 2019, and are comparing it with the spreadsheet posted November 9, 2018. Port staff look forward to discussing the emissions with CARB staff at the public workshop CARB scheduled for February 26, 2019. After that, Port staff anticipate the need for a revised HRA for the Proposed Control Measure that relies on emissions that have been reviewed and understood by all parties.

The AERMOD input and output files and risk estimation databases CARB provided on December 14, 2018, appear to carry out the methodology discussed in the Draft Preliminary HRA, but further review is not warranted until emissions are finalized. In addition to the

---

<sup>1</sup> <https://www.oaklandseaport.com/development-programs/shore-power/>

wharfinger information provided by the Port to CARB annually as required by grant funding obligations, Port staff are happy to work with CARB staff to refine assumptions made in the emissions estimates.

**The role of the Preliminary Draft HRA posted November 5, 2018, in rulemaking for the Proposed Control Measure is not clear.**

The Proposed Control Measure is not an ATCM, in fact its stated purpose is to reduce NO<sub>x</sub>, PM, and GHG but not the toxic air contaminant DPM—which is the focus of the Preliminary Draft HRA. The inclusion of an HRA for any of the ports in California is therefore not a fundamental driver of the Proposed Control Measure (leaving the CARB Governing Board direction, Mobile Source Strategy, and Sustainable Freight Action Plan as drivers). Thus, any reductions in risk shown in the Preliminary Draft HRA are purely informational. Indeed, CARB’s elimination of the At-Berth Regulation ATCM by focusing on a Proposed Control Measure for NO<sub>x</sub> and PM but not DPM seems to imply that no further risk reductions are required.

The Preliminary Health Analyses report announces that the risk reductions of the Proposed Control Measure are “significant,” a term defined in the California Environmental Quality Act (“CEQA”) and used in CARB’s Certified Regulatory Program, but not defined in the CARB rulemaking process. While CARB staff present the percentage of reduction in risk of the Proposed Control Measure over the current At-Berth Regulation, the total residual risk should be compared to that of other source categories to prioritize the need for the Proposed Control Measure.

**Health impacts from Criteria Air Pollutants are managed through SIP Planning, which does not require a new Proposed Control Measure for the container fleet.**

PM<sub>2.5</sub> is a criteria air pollutant, not a toxic air contaminant, and the California Ambient Air Quality Standards (“CAAQS”) and National Ambient Air Quality Standards (“NAAQS”) are the appropriate health-protective standards for PM<sub>2.5</sub>. Regional ambient air concentrations of PM<sub>2.5</sub> are managed to levels below the CAAQS and NAAQS through SIP planning. Even so, CARB’s Mobile Source Strategy calls for an evaluation of emissions reductions from currently unregulated fleets, not the already regulated container fleet which calls Oakland. Thus, SIP planning for PM<sub>2.5</sub> attainment does not mandate an amended At-Berth Regulation to reduce statewide emissions through an “every vessel, every visit” control strategy like CARB staff have proposed.

**The Incidents Per Ton (“IPT”) methodology presented for PM<sub>2.5</sub>, a criteria air pollutant, is not a cost effectiveness metric.**

The IPT methodology provides information on health effects assuming ambient PM<sub>2.5</sub> concentration is the sole contributor to adverse health effects, with a direct linear relationship. The IPT methodology is not, however, part of a cost-effectiveness evaluation. CARB released a “Preliminary Cost Information” document in August 2018 as part of this rulemaking effort,

which relies on the same assumptions as the emissions inventory (which, as discussed above, may need refinement). The preliminary costs data evaluated total costs of the Proposed Control Measure, but not cost effectiveness of proposed measures calculated in terms of cost per ton of emissions removed. CARB has also not yet prepared a socio-economic impact analysis of the proposed rule.

**Closing**

Port staff are interested in working with CARB to improve the current ATCM focused on DPM to allow for 100% compliance. We look forward to seeing enhanced supporting documentation for the CARB emissions estimates and a revised HRA and cost effectiveness analysis once the emissions are updated.

Please contact Catherine Mukai, P.E., Port Associate Environmental Planner/Scientist at [cmukai@portoakland.com](mailto:cmukai@portoakland.com) with any follow-up questions.

Submitted Via Electronic Comment Log

**Subject: Comments on October 15, 2019, Draft Proposed Control Measure for Ocean-Going Vessels At Berth and Supporting Documents**

Dear Ms. Csondes:

The Port of Oakland (“Port”) appreciates the opportunity to comment on the rulemaking materials posted October 15, 2019, for the Proposed Control Measure for Ocean-Going Vessels At Berth (“Proposed Control Measure”). The Port understands that the California Air Resources Board (“CARB”) plans to replace the current Airborne Toxic Control Measure for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (the current “At-Berth Regulation”) with the Proposed Control Measure, with the goal of taking the Proposed Control Measure to the CARB Governing Board on December 5, 2019 at a special meeting to be held in West Oakland. The Port understands that the CARB Governing Board will not vote on the Proposed Control Measure on December 5, 2019, and that comments are due December 9, 2019.

The Port fully supports CARB’s efforts to reduce emissions from ocean-going vessels at berth and is working diligently to maximize the number of vessel visits using shore power. Port staff work collaboratively with shipping lines to provide education and resources about the shore power program. Port staff track shore power usage in real time, collecting detailed information from marine terminal operators. The Port regularly posts up-to-date shore power usage statistics, reasons for vessels not plugging in, and cost information on the Port’s shore power website: <https://www.oaklandseaport.com/development-programs/shore-power/>.

In 2018, 75% of all vessel calls at the Port of Oakland drew shore power (the number for all vessel calls includes steamships and “infrequent callers” which are both exempt from the current At-Berth Regulation), which surpassed the regulatory requirement of 70% compliance. The plug-in rates at the Port of Oakland continue to increase. For example, in October 2019, 100% of vessels

that were equipped with shore power plugged in and 83% of all vessel calls plugged in. This was the third time in 2019 and the second consecutive month where shore power plug-in rates were above 80%. For 2019, the year-to-date average, including October 2019, was 76%.

The Port has commented on previous drafts of the Proposed Control Measure and various supporting documents, and those previous comment letters are enclosed with this comment letter. The Port appreciates CARB's consideration of its past comments and sets forth its new and continuing comments and concerns below.

### **Comments on Emissions Inventory**

The Port has reviewed Appendix H: 2019 Update to Inventory for Ocean-Going Vessels at Berth: Methodology and Results. This inventory is extremely important, as it lays the foundation for the need for, and cost-effectiveness of, the Proposed Control Measure.

The Port appreciates all the hard work that went into the inventory, and the willingness of CARB staff to attempt to explain their methodology. At the same time, Port staff (along with other public seaport authorities and shipping partners that operate in the State) have struggled to understand the inventory results and implications for both Oakland and the State as a whole. Based on the collective feedback that has been received from stakeholders, CARB staff continues to revisit the baseline and forecasted emissions assumptions with updated calculations and results even as this Proposed Control Measure is being put before the CARB Governing Board. In other words, the methodology and analysis upon which the Proposed Control Measure is based, are still in flux.

To highlight just one particularly notable example, the 2020 estimated total hours at berth divided by typical call durations by vessel size indicate that there will be 2,580 calls for the Port of Oakland in 2020, which is a dramatic departure and increase (a deviation of over 40%) from observed operational realities and shipping trends. For context, the Port of Oakland had 1,175 calls in the first 10 months of 2019, 1,543 calls in 2018, and 1,598 calls in 2017. The same calculation applied to CARB values for the Ports of Los Angeles and Long Beach predicts 2,405 calls in 2020, which means Oakland would see 175 more calls than the Ports of Los Angeles and Long Beach combined. Such an order of magnitude difference has implications for evaluating the effectiveness and potential impact of the Proposed Control Measure and any marginal benefits that could be achieved by it.

Port staff compared the 2016 baseline values used by CARB in the inventory to 2016 actual values recorded at the Port. It appears that CARB's 2016 values for total time at berth are about 8% higher than actual, and that CARB's estimates for average power by ship size (which were derived from values at the ports of Los Angeles and Long Beach) are about 9% higher than actual for Oakland. Additionally, it seems that CARB has underestimated the total activity for the regulated fleet in 2016 by about 11%, which makes it appear that the Proposed Control Measure overestimates projected reductions. These over- and under-estimates do not balance out. In fact, they lead to further discrepancies which are compounded by CARB's assumed 21.5% growth rate which is applied equally across all vessel size bins. The Port understands that this growth rate was

developed from the Federal Highway Administration’s Freight Analysis Framework and requests that CARB explain how this growth rate applies to hours at berth, cargo volumes, emissions, ship calls, and cost.

The Port appreciates CARB staff’s recent acknowledgment that the cargo growth rate for Oakland needs to be adjusted. Port staff and CARB staff have had multiple discussions about the growth rate issue, and the Port understands that CARB will consider instead the Oakland-specific cargo forecast commissioned by the Bay Conservation and Development Commission (“BCDC”)<sup>1</sup>. This will lower the forecasted annual growth rate for Oakland from ~4.6% to a more realistic, but still high, forecast of 2.2%. For reference, the Port’s historical compounded annual growth rate from fiscal year 2008 to fiscal year 2018 was 0.4%.<sup>2</sup>

We look forward to evaluating the results and implications of these revised forecasts when the technical work is presented at a future date by CARB staff. The Port seeks assurance that no CARB vote will proceed until the emission reduction estimates reflect more realistic growth rates, for example as provided in the BCDC report.

The Port appreciates CARB staff’s willingness to apply an “efficiency factor” that acknowledges efficiency gains produced by moving more cargo on fewer, larger ships. One point of caution is that the layering of percentages makes it extremely difficult to follow the logic and relate CARB’s forecasted activity and emissions to any real-world metrics. Small errors and invalid assumptions with an initial set of data points can be magnified as these results are extrapolated into later forecast years, which lead to unrealistic and unreliable conclusions. The Port understands the complexity of the task, but a regulation as important and expensive as the one being proposed needs to be based on data that can be fact-checked, and must include forecasts that are grounded in factual operational data.

As an alternative, the Port of Oakland prefers and requests that CARB re-evaluate the inventory using 2016 baseline values provided by the Port and a Port-specific growth forecast. The Port further requests that the forecast activity levels be related to ship calls, which can be readily understood by all ports, regulatory agency staff as well as by the public. This would be consistent with how the Port tracks shore power usage and compliance. Lastly, and most importantly, the Port asks that these changes be made and the inventory fully peer-reviewed before the CARB Governing Board contemplates further action on the Proposed Control Measure.

### **Broad Concerns about the Proposed Control Measure**

The Port is extremely concerned that the Proposed Control Measure adds a substantial additional regulatory burden and cost to carriers and terminals that are already achieving high levels of plug-ins and emissions reductions. As the Port has discussed with CARB previously along with other California seaports, CARB could achieve more cost-effective emissions reductions from other source categories. In fact, during a conference call with CARB staff on Friday, November 22,

---

<sup>1</sup> BCDC is currently amending its Seaport Plan for the San Francisco Bay Area.

<sup>2</sup> From Budget and Finance report at May 23, 2019 Port Board Meeting (File ID 098-19), slide 6.

2019, the Port joined its sister ports in proposing potentially preferred emissions reductions project alternatives based upon readily available specific equipment replacements, which will result in a significant reduction of emissions.

A second broad concern is that the Port of Oakland would be disadvantaged under the Proposed Control Measure because it does not have the option of a CARB approved emission control strategy (“CAECS”) other than shore power. As CARB itself found, the Port of Oakland cannot use a barge-based capture and control (“C+C”) method at three of its four terminals “due to concerns expressed from SF Bar Pilots about wave interaction from passing vessels and channel space and navigational constraints.” (See Appendix E: *Berth Analysis*.) The three terminals cited in CARB’s Appendix E (Everport, Matson, and OICT) account for over 83% of the Port’s call volume.

To elaborate, the potential negative impact to the Port and its carriers, tenants, and the community from the Proposed Control Measure is foreseeable. It is well established that almost every vessel calling Oakland also calls the ports of Los Angeles and Long Beach. Unlike Oakland, the ports of Los Angeles and Long Beach can use a barge-based C+C strategy. What will happen if carriers rely on a barge for compliance at the ports of Los Angeles and Long Beach, and then come to Oakland where a barge is not possible? The Port is very concerned that carriers may bypass Oakland if the Proposed Control Measure is enacted as currently written. Oakland has no feasible C+C alternative<sup>3</sup>, which could put the Port of Oakland at a serious competitive disadvantage.

To address the fact that a barge-based C+C will not work in Oakland, the Port requests that CARB grant Oakland exemptions corresponding to the number of calls that rely on barge-based C+C in Southern California.

As a third concern, the Port understands that the Proposed Control Measure anticipates other emission control strategies such as a land-based C+C system. However, the Port is concerned that landside emissions control approaches were never contemplated for use in the container fleets, have not been analyzed by CARB staff for use in the container shipping trades, and by CARB’s own analysis can result in an increase in greenhouse gas emissions<sup>4</sup>, which would seem to be an unacceptable outcome given the purpose and intent of this rulemaking.

The Port’s fourth concern is the introduction of shared responsibility which potentially creates conflict among vessels, terminals, and ports (see Table 5 of Proposed Control Measure) where none now exists. Upon the adoption of the initial At-Berth Regulation, CARB rightly acknowledged that in a global shipping environment it was not reasonable to expect that every vessel in every fleet would be equipped to receive shore power, hence the creation of fleet compliance averages and an exemption for infrequent callers. The Port has seen that its diligent involvement with carriers and terminals has resulted in a continuous positive trajectory in shore power usage.

---

<sup>3</sup> Appendix E of the ISOR, page 12

<sup>4</sup> Appendix C-1 of the SRIA, page 15

The Proposed Control Measure continues the acknowledgement that there will be instances when ships cannot plug in, due to circumstances on the vessel or at the terminal, hence the inclusion of alternative compliance options and a complex regime of Terminal Incident Events (“TIEs”) and Vessel Incident Events (“VIEs”). The Port understands the goal of the TIE and VIE regime, but it creates more problems such as record-keeping and dispute resolution, than it solves. The Proposed Control Measure has no clear grievance or dispute resolution process when conflicts arise

### **Specific Comments on Proposed Control Measure**

1. Regarding the Terminal and Port Plans required for Container terminals in Section 93130.14, the deadline of July 1, 2021 is confusing because the Compliance Start Date listed in Section 93130.7(b) is shown as January 1, 2021. Shouldn’t the Plans and associated 90-day review window be completed prior to requiring compliance?

Port staff object to the text in Section 93130.14(a) that “[a]s an alternative, Ports may submit plans for their terminal operators.” Ports should not be expected to submit plans for terminal operators. In addition, the statement in Section 93130.14(b)(1) that “Ports should use terminal plans as [the] basis for developing port plans” seems to indicate that the deadline for Port Plans should be adjusted to come after the deadline for Terminal Plans.

2. The definition of “Fleet” in Section 93130.2(b)(29) does not explain how fleets will be established. What will CARB require at the beginning of each compliance year to establish fleets? How will this work?

The proposed regulation does not address how or whether VIEs will be granted for new fleets entering the California market, or for fleets that expand. New entrants should be allowed to estimate their annual ship calls and be granted the associated number of VIEs for the coming year. Otherwise, this is a barrier to entry for new fleets because they will be granted zero VIEs in their very first year of operation. This puts California ports at a competitive disadvantage compared to ports in Oregon, Washington, Canada, Mexico, and on the U.S. Gulf and East Coast.

The definition of Fleet and the requirements for VIEs also need to be responsive to changes in the shipping industry, for example when businesses merge or alliances change. It is not clear whether VIEs will be granted on a port-specific or State-wide basis. It is also not clear how disagreements will be resolved on whether a specific instance should use a TIE or a VIE. Will CARB adjudicate these?

3. The Port is glad to see that Vessel Commissioning is specifically exempt from the rule, as listed in visit exception Section 93130.8(c). However, the Port notes that it should not be limited to only the first visit, and should not matter whether the commissioning was successful. What happens if the commissioning was not successful? The Port of Oakland requires that vessels be re-commissioned if they have not been in Oakland for over a year. Further, the same vessel might need commissioning on both port side and starboard side. For these reasons, the same ship might require multiple commissioning trips.

Port staff request that vessel commissioning events that do not successfully connect to shore power as discussed in Section 93130.8(c) be eligible for exceptions under the regulation without the use of a VIE. The commissioning attempt shows that the goal was to reduce emissions through shore power and as such should be an exception in this situation. Port staff conduct each vessel commissioning (with the exception of those at Berths 61-6<sup>5</sup> to ensure the safety of the vessel, terminal, and workforce. Vessel commissioning is an invaluable safety procedure and should not be penalized under the Proposed Control Measure.

The Port requests that the definition of “Vessel Commissioning” in Section 93130.2(b)(76) of the Proposed Control Measure be expanded to include the port authority as the commissioning agent, as is the case at the Port of Oakland. The same language is found in Section 93130.7(e)(2) (“Ensure the vessel is commissioned as required by terminal operator”), Section 93130.8(c)(2) (“The terminal requires that the vessel be recommissioned”), and Section 93130.9(a)(2) “The terminal operator is responsible for commissioning vessels equipped with shore power.”). The commissioning requirement should be determined by the port authority or the terminal operator.

4. The Port requests that the definition of “Ready to Work” in Section 93130.2(b)(55) be expanded to include “Auxiliary Marine Power (AMP) container has been loaded on the ship and is in position, if applicable.” This is crucial for the requirement in Section 93130.9(d)(2)(D) that the vessel be plugged in “within 1 hour of vessel “Ready to Work”.” Many of the ships that call at the Port of Oakland rely on an AMP container to connect to shore power. The AMP container is often domiciled at the terminal and needs to be loaded onto the vessel by a ship-to-shore crane prior to plugging in. Some of the major carriers calling in Oakland rely on an AMP container to use shore power [MOL, NYK, K-Line (the ONE Alliance), Hyundai, and APL]. A vessel is not ready to plug in until the AMP container is in position.

Likewise, the Port requests that the disconnection requirement in Section 93130.9(d)(2)(E) be re-written to accommodate certain situations where the AMP container has been removed from the ship prior to the pilot boarding.

5. The Port appreciates the increase in TIEs to 15% for the first four years of the regulation as listed in Table 3 of Section 93130.11. The Port requests that the number of TIEs and VIEs be rounded *up* to the nearest whole number instead of rounding to the nearest whole number for instances where the number of TIEs or VIEs is calculated at a fraction of ship call as stated in Section 9310.11(a)(2). Any fractional call should be counted as a whole call. For example, if a carrier made 49 calls to a California port in 2019, the VIE calculation

---

<sup>5</sup> The Port does not commission vessels at the Matson Terminal because these shore power vaults were installed by the former tenant, APL. The current terminal operator has assumed responsibility for these vaults.

would award 2.45 VIEs at the 5% level. This should be rounded up to three, not down to two.

6. Regarding the Remediation Fund described in Section 93130.15 of the Proposed Control Measure, what is the procedure and timeline for CARB to approve a public entity to manage the funds generated at the Port? What happens if no Remediation Fund administrator is established per Section 93130.15(a)? Does that mean the Remediation Fund would not be an option?
7. Port staff request further information from CARB on when and where the Remediation Fund will be deployed. Given that CARB anticipates zero-emissions regulation on trucks, transport refrigeration units, forklifts, and cargo-handling equipment in the time frame of enhanced usage of the Remediation Fund, would those categories be ineligible for incentive-funded emissions reductions?
8. Port staff note that the power meter readings required in Section 93130.9(d)(2)(C) and (F) and Section 93130.9(d)(3)(I) are not available until the close of each calendar month. This means that it will often not be possible to report the power usage within seven calendar days of a vessel's departure, as required in the Proposed Control Measure.
9. In Section 93130.1 of the Proposed Control Measure, the stated intent of the Proposed Control Measure is "to reduce oxides of nitrogen (NOx), reactive organic gases (ROG), particulate matter (PM), diesel particulate matter (DPM), and greenhouse gas (GHG) emissions from ocean-going vessels while docked at berth at California ports." How will CARB monitor GHG emissions after implementation of the Proposed Control Measure? What is the GHG emissions baseline?
10. The Port requests that maintenance events of landside shore power equipment be included in Section 93130.9(f) along with "construction or repair" so that maintenance events also have the option of using a TIE.
11. The Port requests that the Proposed Control Measure include an exemption for liquefied natural gas (LNG) powered vessels. This would have the desired effect of incentivizing cleaner ships, which would provide significant emission reductions throughout the ship's voyage, not just the small fraction of time while the ship is at berth in California.

## **Conclusion**

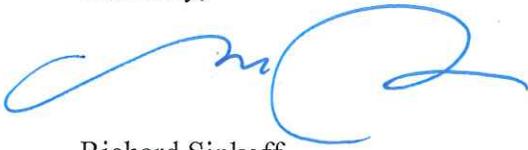

In conclusion, the Port of Oakland is fully committed to reducing emissions, and is proud of the results achieved with its industry and regulatory partners. In fact, the Port is unaware of any other port authority in the world that plugs in as many container vessels on an annual basis as the Port of Oakland. The partnership and collaboration with CARB, the Bay Area Air Quality Management District, and the Port's shipping and marine terminal customers have been a key to the success of

this program. The Port believes that these efforts can be used a model for other states and nations who might seek to reduce localized emission from ships at berth.

Port staff appreciate the opportunity to review and comment on the Proposed Control Measure and attend the public workshop on December 5, 2019. We look forward to continuing to work with CARB towards improving shore power effectiveness, emissions inventories, and associated analyses and to collaborate together to achieve cost-effective and feasible air quality improvements to protect public health.

Re: WSPA Comments on "15-Day Changes" to CARB Proposed Control Measure for Ocean-Going Vessels at Berth

To the Clerk of the Board:

This letter supplements comments previously submitted by the Western States Petroleum Association (WSPA) on the California Air Resources Board's (CARB) Proposed Control Measure for Ocean-Going Vessels at Berth (Proposed Regulation), originally released October 15, 2019, and on the "15-Day Changes" to this original text, which were released March 26, 2020. WSPA is a non-profit trade association representing companies that explore for, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California and four other western states.

WSPA is providing these comments as part of a continuing effort to provide feedback on the At Berth Regulations. We incorporate our previous comments submitted on February 15, March 29, May 30, June 14, August 15, December 3, 2019 and March 6, 2020 by reference herein.

### **March 6, 2020 WSPA Comment Letter**

Please note that the comments that we submitted on March 6, 2020, in order to allow additional time for CARB staff to review and consider them, are submitted again as an attachment hereto for inclusion in the administrative record (see Tab 1). These comments outlined in specific detail a proposal to allow an alternative compliance option that would meet the same emission reduction goals in lieu of the control requirements in the Proposed Regulation, as well as proposed language to allow a feasibility study to be conducted. We are providing those comments again in response to the statement by CARB Chair Mary Nichols at the December 5, 2019 hearing on the Proposed Regulation that written comments submitted after December 19, 2019 but before the notice of 15-Day Changes will not be considered as part of the "official record." CARB December 5, 2019 Hearing Transcript ("Transcript"), Tab 2, at 150:12-14.

#### **I. Summary of Concerns**

- The 15-Day Changes completely ignore the COVID-19 pandemic and fail to account for any impacts to CARB staff's original baseline emissions or economic assumptions.
- CARB staff provide no basis for accelerating the already-unrealistic deadlines for tanker compliance by two years in the 15-Day Changes, which would create serious safety risks for tanker terminals. The 15-Day Changes also fail to address the need for a feasibility study as articulated in WSPA's March 6, 2020 letter.

49-1

- The proposed “Innovative Concepts” provisions in the 15-Day Changes are **not** the compliance alternative WSPA requested. WSPA was clear in its March 6, 2020 letter to CARB and in discussions with CARB staff that stakeholders need a viable compliance alternative **in lieu of** a requirement to install and operate at berth capture and control equipment, not a temporary **additional** obligation to the still-infeasible capture and control requirement. The “Innovative Concepts” provisions contain several significant limiting conditions, which strongly disincentivize funding by stranding investment and creating significant compliance risks. By structuring the “Innovative Concepts” provisions in this way, CARB essentially conveys that the only acceptable compliance option is control of at berth emissions.
- The 15-Day Changes do not address the comprehensive regulatory language revisions recommended by WSPA in its March 6, 2020 letter.

## II. Overview

For the past year and a half, WSPA has repeatedly communicated and submitted in writing to CARB staff critical safety and feasibility concerns with the Proposed Regulation. For a technology to be considered proven, all engineering and process safety considerations need to be evaluated and determined feasible. The technologies identified in this rulemaking to support the expected reductions must be evaluated and deemed feasible prior to setting or accelerating any compliance date. Comments from WSPA and others have shown that the types of emissions capture and control equipment that would be required by the current Proposed Regulation have not been proven safe and feasible in real-world operations with tankers at marine terminals. These comments also have explained in detail that no proven and currently available technology exists to allow terminals to meet the proposed emissions standards by the 2027 or 2029 deadlines contained in the original Proposed Regulation.

49-2

In response to these comments, CARB staff are proposing to **accelerate** each of these deadlines, requiring compliance two years sooner than the deadlines CARB staff themselves had proposed and argued in favor of just four months ago. The sole reason given for advancing the deadlines is that the CARB Governing Board directed CARB staff to do so. CARB staff have pointed to no evidence in the administrative record to justify the acceleration, nor have CARB staff explained how they believe the regulated community could possibly meet the new deadlines. CARB staff also have offered no response to the undisputed information in the record showing that the lack of proven safe and feasible capture and control systems for tanker terminal visits would make implementation impossible by the **original** 2027/2029 compliance dates, let alone the **accelerated** 2025/2027 deadlines.

49-3

For that reason, the 15-Day Changes now would place tanker vessel operators and marine terminal operators in an even more dangerous position by effectively requiring them to put untested equipment and processes into operation before crucial feasibility and safety studies can be completed. Indeed, the 15-Day Changes systematically ignore all of the identified risks associated with applying unproven technologies to oil tankers by requiring Terminal and Port plans to be submitted prior to CARB’s Interim Assessment. Accordingly, WSPA is compelled to respond by reiterating and supplementing our concerns arising from the infeasibility of timely compliance with the Proposed Regulation, now rendered even more infeasible by the 15-Day Changes which advance the deadlines and reduce time already insufficient for adequate feasibility and safety studies. As such, these comments (including our March 6, 2020 comments attached hereto for the record) cannot be dismissed as unrelated to the 15-Day Changes.

49-4

Pointing out the intractable feasibility concerns with the original Proposed Regulation, WSPA and other stakeholders urged CARB staff to at least allow for a viable alternative compliance path to the Regulation's capture and control requirements, permitting regulated parties to secure emissions reductions from other sources rather than through attempting to adopt unproven and potentially unsafe capture and control measures for tankers at berth. The 15-Day Changes do not provide the alternative compliance path we requested. Instead, the 15-Day Changes would adopt a limited "Innovative Concepts" provision that fails to provide a true "in lieu of" alternative to mandated implementation of (yet-unproven) at berth capture and control measures. The proposed "Innovative Concepts" would offer only a temporary substitute for at berth capture and control requirements, would set narrow locational constraints on potentially valid projects, would be subject to revocation and/or refusal to renew at CARB's unreviewable discretion, and would result in imposing unreasonable additional burdens on the regulated community. Indeed, because the 15-Day Changes would provide no relief **at all** from the parallel deadlines to install at berth capture and control as a CARB-approved emission control strategy (CAECS), CARB's refusal to renew an "Innovative Concept" would create a compliance trap for tanker terminals, leaving them with even fewer years to meet the already-infeasible 2029/2027 deadlines.

### **III. The 15-Day Changes Completely Ignore Impacts From the COVID-19 Pandemic**

As an initial matter, the 15-Day Changes make no mention at all of the COVID-19 pandemic that has impacted California and the nation. Aside from providing 20 additional days for public review and comment, CARB staff propose no alteration of the At Berth Regulation or this rulemaking to account for the unprecedented social and economic disruptions caused by the pandemic.

Numerous stakeholders have joined WSPA in urging CARB to postpone this and other non-essential rulemakings in light of the worldwide disruptions caused by COVID-19. See Tab 3 (Letter dated March 20, 2020 from California Association of Port Authorities, Cruise Lines International Association, Pacific Merchant Shipping Association, WSPA and World Shipping Council); Tab 4 (Letter dated March 24, 2020 from International Longshoreman and Warehouse Union and California Association of Port Authorities); Tab 5 (Letter dated April 15, 2020 from California Chamber of Commerce, local chambers of commerce and other organizations to Governor Newsom); Tab 6 (Letter dated April 10, 2020 from the California Manufacturers Association and other organizations, including WSPA, to Governor Newsom); Tab 7 (Letter dated April 21, 2020 from state legislators to CARB Chair Nichols).

COVID-19 has caused a worldwide collapse of economic activity not seen since the Great Depression. The Centers for Disease Control and most leading national health organizations now estimate that social distancing restrictions will need to continue throughout the summer of 2020, even in a best-case scenario. The Federal Reserve expects year-over-year gross domestic product to plummet by 30% in the second quarter 2020. Unemployment throughout the United States is forecasted to spike by the middle of 2020, with over 26 million new unemployment claims in the last five weeks ending on April 23. Over the three weeks prior to April 23, California processed about 3.4 million unemployment claims. These claims represent about 17% of the U.S. and California workforce, respectively. See Letter from Brad Williams (Capitol Matrix Consulting), April 27, 2020 ("CMC Analysis") (attached at Tab 8), pp. 3-4.

As one of the global hotspots for the pandemic, California continues to undergo mass quarantines, travel bans, a statewide stay-at-home order, and the virtual halting of the fifth largest economy in the world. Governor Gavin Newsom declared a State of Emergency in California on March 4, 2020 and has since issued nearly two dozen Executive Orders waiving or altering statutory and

regulatory requirements to account for statewide response to the COVID-19 pandemic. Stakeholders affected by the Proposed Regulation are and must be focused on business continuity and the health and well-being of thousands of California citizens in their employ.

Port and terminal activities have been significantly disrupted by the pandemic, with numerous vessel visits rescheduled or cancelled, personnel availability severely restricted, capital infrastructure construction activities delayed or scrapped, and company resources redirected to emergency response and support of efforts designed to slow the spread of the coronavirus (See Tab 4).

In short, “every key economic assumption in the CARB estimate of the proposed regulation has been dramatically affected by the COVID-19 pandemic.” CMC Analysis (Tab 8), p. 3.

Aside from providing a few weeks of additional public comment on the 15-Day Changes, CARB staff have made **no alterations whatsoever** to this rulemaking schedule or the Proposed Regulation itself in light of the devastating impacts of the COVID-19 crisis. Instead, CARB staff propose to tighten the compliance deadlines by two years. Even attempting to meet the new deadlines (which we believe are ultimately infeasible) would require immediate investment of resources and personnel that, as a practical matter, are unavailable in the middle of the pandemic. This is unacceptable at a time of unprecedented upheaval in California.

49-5

Attached to this comment letter is an independent analysis by Capitol Matrix Consulting (CMC) describing the unprecedented global economic impacts of COVID-19, and illustrating why CARB staff’s emission projections, the Standardized Regulatory Impact Assessment (“SRIA”) and the updated analysis of cost impacts in the 15-Day Changes are now outdated. The analysis concludes that “[t]he COVID-19 virus has fundamentally altered the economic landscape. The Department of Finance May 2019 economic forecast and the EIA fuel price projections, and other inputs used by CARB to develop the benefits, costs, and economic impacts of the proposed regulation are no longer credible.” CMC Analysis (Tab 8), p. 6. As of April 10, the Department of Finance (DOF) has indicated a dramatic shift in its forecast, and now anticipates the California unemployment rate could peak at a rate higher than the Great Recession of 2008, and that economic softness could persist into 2020-21 and beyond depending on the pace of recovery to local, state, and national economies. *Id.*, p. 4. In an April 10 letter addressed to the state Legislature, DOF referenced a multi-year recession alternative included in its January budget and indicated that actual increases in unemployment would be much larger. *Id.* Thus, because of the pandemic, “[f]uel prices, economic output, jobs, international trade and waterborne port activity will all be sharply lower than anticipated in any economic forecast made prior to March of this year. Given the emerging expectation that recovery from the historic COVID-19-related downturn will be slow. . . we expect the economic measures will remain below the levels assumed in the CARB projections for several years to come.” *Id.*, p. 3. This new post-COVID-19 reality will have significant impacts on baseline emissions, estimated emissions reductions, predicted health cost savings, specific economic impacts to California ports and terminals, and the more general impacts to California’s economy and the citizens who rely on it. *Id.* CARB staff should have assessed all of these post-COVID assumptions before releasing the 15-Changes. Its failure to do so is a violation of California law.

49-6

CARB staff’s forecasted tanker vessel activity in the 15-Day Changes continues to be based on two sources: the 2016 Mercator report developed for the Ports of Los Angeles and Long Beach (“Ports”) to assess economic outlook considering global and domestic economic factors along with competition from other port regions; and the Federal Highway Administration’s Freight

49-7

Analysis Framework for Northern California ports. Both reports assume static increases in potential GDP starting in the year 2020, and do not assume any shocks to the economy. This assumed GDP growth is then used to estimate future vessel visits and vessel emissions growth. CARB staff have relied on these two reports to generate forecasts for vessel emissions through 2040 to determine the Proposed Regulation's value, currently estimated by CARB staff to be about \$2.4 billion by 2040. Without revisiting expected economic and vessel activity in these regions in the wake of the COVID-19 crisis, these numbers will bear little relation to reality. California's economic activity has been affected dramatically by COVID-19 in 2020, and likely will feel effects into the next few years. For that reason, the outdated estimates being used by CARB staff now significantly overstate the At Berth Regulation's value and its potential emissions savings, while understating or completely ignoring negative impacts on the very communities the Regulation seeks to protect.

49-7  
cont.

CARB staff's failure to take into account the impacts of COVID-19 in proposing the 15-Day Changes violates several requirements of California law. First, CARB staff have not discussed or even acknowledged the potential effects of the pandemic and the resulting economic freefall on stakeholders' ability to comply with the Proposed Regulation by its now-accelerated deadlines. Shipping commerce and vessel traffic have been substantially impacted by the virtual collapse of economic activity in California, and likely will feel effects from the pandemic well into 2021. The entire economic baselines of the shipping and petroleum industries are now radically different than the scenarios assumed by the SRIA released by CARB staff in August 2019 and the updated analysis of impacts on costs in Attachment B to the 15-Day Changes. California law and regulations mandate that CARB staff reassess the impacts of the Proposed Regulation in a revised SRIA, in light of these new economic realities facing the regulated industries and the California families who rely on them.

Second, CARB staff are obligated by law to reassess the impacts the pandemic may have on regulated parties to allocate sufficient resources to timely plan, construct and commission the substantial infrastructure that would be required by the Proposed Regulation. The 15-Day Changes' acceleration of compliance deadlines, discussed further below, reduces the already insufficient time for marine terminal owners and operators to safely complete all of the steps necessary to design and build control and capture facilities – even though no such real-world systems to date have been designed or demonstrated to safely work with tankers. For most California marine terminals, the ability to mobilize personnel and resources to launch major capital projects will be constrained for a considerable time. As of this date, most employees of regulated companies are still subject to stay-at-home orders, and they and their companies will be addressing the fallout of the COVID-19 crisis for months to come. CARB staff have addressed none of these concerns in the 15-Day Changes, as they are required to do under California statutes.

49-8

#### **IV. The Accelerated Deadlines for Tankers Proposed in the 15-Day Changes are Not Feasible and Ignore the Evidence in the Record**

One of the most significant provisions of the proposed 15-Day Changes involves the acceleration of implementation dates for ro-ro and tanker vessels. The 15-Day Changes propose to advance the compliance start dates for tanker vessel controls from 2027 to 2025 for vessels visiting the Ports, and from 2029 to 2027 for all remaining tanker vessels visiting California terminals. Also, updates to terminal plans for tankers now would be required in 2026 instead of 2028, and CARB's interim evaluation of tanker technology would be accelerated from June 2023 to December 2022. CARB staff cites to no evidence to support any of these accelerated deadlines in the 15-Day

49-9

Changes. The deadlines in the original Proposed Regulation were already infeasibly short, and the 15-Day Changes severely exacerbate the problem. Contrary to CARB staff's assertions, the accelerated deadlines will not result in "more emissions reductions in earlier years" and will not result in the health benefits claimed by CARB staff (see Notice, Attachment D), since these reductions cannot be achieved by tanker terminals by the original deadlines, let alone ones that are two years earlier.

49-9  
cont.

A. The 15-Changes Fail to Address the Need for a Feasibility Study, and Would Result in Serious Safety Risks at California Marine Terminals

As noted above, WSPA and other stakeholders have provided numerous comments to CARB staff (most recently in a comment letter submitted on March 6, 2020) documenting that the types of capture and control systems intended for compliance with the Proposed Regulation have not been shown to be safe or feasible for use on tankers calling on marine terminals. For this reason, WSPA and others have explained to CARB staff that there is no evidence today that such control systems could be safely implemented for tanker terminals by the original 2029/2027 deadlines contained in the Proposed Regulation, and have repeatedly called for completion of a feasibility study before any capture and control requirements are imposed on marine terminals serving tankers.<sup>1</sup> These points have been substantiated time and again in the administrative record.

49-10

Ignoring the record evidence, CARB staff now propose not only to retain the requirements for marine terminals to adopt yet-unproven control systems for tanker visits, but to **accelerate** the deadline for implementation by two years for such visits. CARB staff have cited no evidence in the record to support this acceleration.

In fact, the record evidence strongly supports the conclusion that the original 2029/2027 implementation deadlines were unrealistic, and that now-**accelerated** 2027/2025 deadlines would be dangerous. As the diagram in Tab 9 illustrates, oil tankers differ from container ships in several important ways, including in the fact that safety considerations are critical on a tanker given its flammable and potentially explosive cargo. See Tab 9 ("Stack Capture is not ready for pilot testing on tankers"). Attempting to design and construct marine terminal capture and control for oil tankers without first conducting a feasibility study would put human lives at serious risk. As WSPA and others have commented, no feasible oil tanker capture and control technology exists today. Because they carry flammable and potentially explosive cargo, tankers are subject to extremely rigorous international and industry safety guidelines, such as the International Safety Guide for Oil Tankers and Terminals ("ISGOTT"). These guidelines ensure that oil tankers all over the world can dock at terminals safely and efficiently, following uniform and expert-reviewed procedures that help to minimize the risk of sparks or other ignition sources, such as static electricity. Barges and other vessels are not permitted to approach alongside a tanker. Measures must be taken during loading and unloading to ensure that the hull does not generate a static charge due to lack of grounding. Also, California law requires oil tankers during all times of loading and unloading to maintain the ability to break away from the dock quickly (i.e., within 30 minutes) in an emergency.

49-11

In addition, during loading and unloading of oil, vessel operators must take special precautions to ensure the remaining empty cargo space does not develop an explosive atmosphere. Vessel operators must continuously fill this space with inert gas – typically, a mixture of carbon monoxide

---

<sup>1</sup> Further, WSPA has commented that if any technology is deemed to be too risky or unsafe for a port or terminal or vessel operator, that technology should be eliminated as a compliance option, and CARB should provide a sufficient amount of time for a port or terminal or vessel operator to develop a new plan without any form of penalty.

and carbon dioxide taken from the tanker boilers' exhaust gas – to ensure oxygen content remains between 3.5 to 4% and an explosive atmosphere is avoided. As loading or unloading continues, the operation of the boiler must be finely tuned to inject the precise amount of water, run the pumps at the precise rate, and fire the boiler as fast as needed to maintain the safe inert gas mix in the cargo spaces.

Failure to follow stringent safety measures in handling empty cargo space at berth can lead to catastrophic results:

- On the night of December 17, 1976, the oil tanker SS Sansinena docked in Los Angeles Harbor and unloaded some 20 million gallons of crude oil from its vessel tanks. The vessel vented its cargo tanks to the atmosphere, as was allowed at that time. The breeze was insufficient to disperse the crude oil vapors, and an ignition source on the vessel ignited them. This caused a massive explosion, killing nine people, breaking the SS Sansinena in two, and flinging pieces of the ship's deck 200 feet onshore. See Tom Guldner, *A crude oil tanker exploded – Why is that unusual?* (Oct. 12, 2018), <https://iffmag.mdmpublishing.com/a-crude-oil-tanker-exploded-why-is-that-unusual/> (attached at Tab 10). This incident helped prompt significant changes in the rules for oil tankers at berth, including the development of strict requirements for the management of oil vapors on tankers during and following loading and unloading.
- On June 12, 2003, the tanker Chassiron suffered an explosion and fire shortly after an unloading and loading stop in Bayonne, France, killing the ship's pumpsman and ripping the deck of entire vessel open from bridgehouse to manifold. The explosion was attributed to the formation of an explosive atmosphere in the tanks, ignited by static electricity or some other mechanical form of ignition. See "Technical Report of the Inquiry Into the Explosion On Board the Oil Tanker Chassiron" (excerpts), pp. 4, 63-65 ([http://www.bea-mer.developpement-durable.gouv.fr/IMG/pdf/RET\\_CHASSIRON\\_En\\_Site.pdf](http://www.bea-mer.developpement-durable.gouv.fr/IMG/pdf/RET_CHASSIRON_En_Site.pdf)) (attached at Tab 11).
- On January 15, 2012, the oil tanker Doola 3 exploded shortly after offloading its cargo in South Korea, killing 11 members of the 16-member crew. The likely cause of the explosion was determined to be ignition of tank vapors by buildup of static electricity on the vessel. See "Industry supports calls for IGS on small tankers," Riviera Newsletters (Apr. 11, 2017) (<https://www.rivieramm.com/opinion/opinion/industry-supports-calls-for-igs-on-small-tankers-29052>) (attached at Tab 12).

49-12

***No international or industry group has done a feasibility study to assess whether a shore-based capture and control system could be designed and implemented for oil tankers in a manner that would not compromise integrated safety systems, ship designs and procedures necessary to avoid the types of serious consequences discussed above.*** The location of the scrubber equipment on or near the vessel would have to either be explosion-proof or located outside of any hazardous classified areas – too far of a distance for an articulating arm – all while keeping exhaust vapors in the vapor phase and at levels needed for the proper function of the scrubbing equipment. This will present challenges for the hundreds of different vessel layouts visiting California's terminals.

49-13

Even assuming that an appropriate shore-based capture and control system could be designed and constructed, no group has assessed whether and what changes might be required on the oil tankers themselves to safely accommodate such systems. Oil tankers can have four, five or more

separate stacks for their various boilers and generators. No feasible interface has yet been developed to connect to those stacks and capture of emissions would have impacts on the mix of inert gases necessary to prevent an explosive atmosphere in the tankers' cargo spaces. Therefore, on-vessel changes would need to be researched, developed and implemented internationally to ensure that tankers operating throughout the world could safely connect to and operate with any such shore-based systems. CARB has no evidence to date that such shore-based technologies are safe or feasible, no international standard exists to design them, no guidance exists on how they could be safely operated, and no assessment has been made of the on-vessel changes that likely would be required.

49-13

Even presuming for sake of argument that some standards for shore-based capture and control for oil tankers could **eventually** be developed, CARB staff have provided no evidence that they could be implemented by the deadlines proposed in the 15-Day Changes. Industry typically requires five or more years to research any new safety procedure and rewrite the ISGOTT guidelines to implement it. Newly-required systems often are then phased in over a period of years to ensure smooth implementation. Oil tanker operators would then need to design the proposed on-vessel changes, and marine terminal operators would have to design the proposed shore-based system. The California Environmental Quality Act ("CEQA") and other state and local permitting reviews would need to be completed for the terminal, which can take several years. Once a terminal project is permitted, construction could take another 5-10 years, based on industry experience with other major infrastructure changes at California marine terminals. Thus, even assuming that a shore-based oil tanker capture and control system were feasible today (which it is not), that system would have no chance of being ready and permitted for operation before 2032, or potentially years later. Under the proposed 15-Day Changes, terminals could reach their implementation deadlines before the projects are even finished with **permitting**.

49-14

Given these realities, oil tankers likely would not be in a position to safely accommodate shore-based capture and control for more than a decade. Thus, the proposed 15-Day Changes would only result in oil tankers finding terminals outside California where they would not be subject to capture and control requirements. Staff have not analyzed the economic impacts of that diverted vessel traffic to California's economy using the original 2029/2027 deadlines, and they certainly have not addressed the additional impacts that would result from moving that deadline up two years. Oil tanker vessel operators and terminals should not be asked to jeopardize the industry's safety standards to meet unrealistic regulatory deadlines for a technology that does not yet exist.

49-15

B. CARB's Governing Board Directed Staff to Investigate the Feasibility of Accelerated Compliance Dates, Not Simply Impose Them

The only explanation CARB staff offer for the acceleration is to concede that "[t]his change is proposed in direct response to CARB Board's request at its December 5, 2019 Governing Board hearing to accelerate implementation dates in order to achieve earlier public health benefits from the regulation." See Notice of Public Availability of Modified Text and Availability of Additional Documents and Information on Proposed Regulation ("15-Day Notice"), p. 7.

CARB staff appear to mischaracterize what the Board said in the December 5, 2019 Governing Board hearing. In that hearing, no member of the Board actually requested that CARB staff "accelerate implementation dates" for marine terminals hosting tankers, nor did the Board's final Resolution 19-28 from the hearing instruct CARB staff to substitute accelerated deadlines in the Proposed Regulation (the Resolution says nothing regarding any changes to the proposed compliance dates). In testimony during the hearing, some Board members did call for

accelerating the time for the interim “technology review” to determine whether the proposed requirements could be feasibly met for tankers:

Thus, at most, the Board instructed CARB staff to (1) investigate how to prioritize the “technology review” needed to assess feasibility for tankers, (2) investigate and explain **whether** accelerating deadlines would be a possibility, and (3) to reassess whether the existing deadlines could be realistically achieved. At no point did the Board “request [CARB staff] . . . to accelerate implementation dates,” but to analyze whether such acceleration could be justified and would be feasible.

C. Information Recently Added to the Administrative Record Does Not Support Accelerated Compliance Dates

Some Board members’ belief that accelerated deadlines may be possible could be attributable, at least in part, to inaccurate statements made by CARB staff and others at the December 5, 2019 Governing Board hearing on the Proposed Regulation. At that hearing, CARB staff erroneously represented to the Board that no operational and safety considerations needed to be addressed with regard to a safe tanker/shore interface and standardized operational procedures for control equipment involving a tanker and an emission capture system. We highlight three examples of such statements below and include other examples in an attachment to this letter (see Tab 13).

- At the December 5, 2019 Governing Board hearing, CARB staff asserted that a feasibility study was completed for tankers, that this feasibility study is fulfilled by the 2018 Technical Assessment and staff report, and that any remaining feasibility study is site-specific. However, the two documents CARB staff refer to do not reference any example of stack capture being safely and successfully applied to tankers, nor any analysis of how stack capture can be re-designed to operate safely on tankers. In fact, in these documents CARB staff have conceded that more tests and safety studies need to be performed *before* attempting to use stack capture on tanker vessels, regardless of site or location. In CARB staff’s own words:
  - “Although these shore-based and barge-based emission control systems are effective at reducing PM and NOX emissions on container vessels, **more testing is needed on other vessel types, including tankers**, auto carriers, general cargo and bulk cargo.” CARB Draft Technology Assessment: Ocean-Going Vessels, May 2018, p. 72 (emphasis added);
  - “**Regardless of location, safety studies need to be performed to ensure all safety considerations are met**, given that the tanker vessels carry explosive cargos.” CARB Staff Report: Initial Statement of Reasons (Oct. 15, 2019), p. III-22 (emphasis added); see *also* ISOR, Appendix B (Cost Analysis) to Appendix C-1 (SRIA), p. 38 (identifying feasibility study costs for tanker terminal capture and control projects among the costs required for implementing land-based capture and control systems).
- Also, at the December 5, 2019 Governing Board hearing, CARB staff alleged that “technology manufacturers have assured CARB staff that there are engineering solutions for both ro-ro and tanker vessels.” Transcript, Tab 2, at 26:10-12. While technology providers may have assured CARB staff that capture and control has proven feasible on vessels other than tankers, or that engineering solutions to enable controls on tankers

49-16

49-17

might be developed at some future date, they have not stated that these solutions **currently** exist. In fact, on April 16, 2019 during a CARB At Berth Regulation Working Session, a lead technology provider (Advanced Environmental Group (AEG)) stated in a presentation that the land-based system faces a number of design challenges when applied to any tanker vessel, including safety (a higher hazard level, need for safety standards and procedures, emergency protocols) and ability to design and operate a larger and more complex configuration.

49-17  
cont.

- In the December 5 hearing, CARB staff suggested that shore power is widely used and claimed at various points that shore power is feasible and “demonstrated to be effective for tankers.” Transcript, Tab 2, p. 37:8-9. This simply does not square with real-world practice or with the significant weight of evidence in the record. Use of shore power for tankers still faces substantial technological and investment hurdles, making meaningful reductions of at berth emissions by shore power infeasible for tankers by either the originally proposed or the accelerated compliance deadlines. Currently, there is no international engineering standard for shore power connections to tankers, nor is there any requirement for tanker vessels to be fitted with a shore power connection. Development of such a standard and retrofitting of vessels to meet that standard would take time and occur on a schedule beyond CARB’s authority to mandate.<sup>2</sup> Tankers not equipped with shore power would be unavailable for charter to California. At terminals like Chevron’s Richmond Long Wharf (“RLW”), for example, the infrastructure needs are substantial because existing electrical infrastructure cannot handle the additional load and existing terminal facilities cannot support the additional weight and footprint of shore power equipment. Implementation of shore power will be further complicated by “grid-neutral” requirements (discussed further below), given that the power to supply some terminals is a combination of grid and on-site cogeneration electricity.

49-18

CARB staff also received an October 14, 2019 letter from AEG and an October 21, 2019 letter from EnviroCare International and heard a December 5, 2019 presentation from the Coalition for a Safe Environment, discussing the state of marine control and capture technology. None of these communications support the accelerated compliance dates proposed in the 15-Day Changes:

- EnviroCare’s letter discusses the feasibility to control SOx and PM from vessel exhaust gas but does not address the feasibility of capturing exhaust gases, which is a critical safety issue for oil tankers (as discussed above). Also, the EnviroCare system is not designed to remove nitrogen oxides (NOx), which is the target pollutant of the At Berth Regulation, and has conceded that “the technical challenge is to cost effectively transport the gases from the ship funnel to the emission control equipment.” In contrast, WSPA has provided robust comments on the safety and feasibility concerns in attempting to capture exhaust gases from tanker vessels, and the timeframes that would be necessary to conduct a feasibility study to analyze those concerns. EnviroCare’s letter does not add evidence to the record addressing these safety and feasibility concerns, and certainly

49-19

---

<sup>2</sup> Not only is there no standardization in the electricity voltage or distribution frequency between foreign vessels and United States standards, but vessels themselves are each unique and would require extensive retrofitting to add a number of new points of potential sparking (e.g., routing cables throughout the ship, mounting a switchgear and cable reels to the deck, etc.) CARB staff have provided no feasible path for tanker vessels to install this equipment in accordance with current ISGOTT safety guidelines designed to prevent fire and explosion.

does not support an acceleration of the compliance deadlines as proposed in the 15-Day Changes.

- AEG’s letter speculates that any challenges for implementation of capture and control for tankers can be overcome, but does not offer any specific technical review, feasibility study or other empirical evidence to support that speculation. AEG’s letter supplies no information on necessary modifications to vessel equipment to accommodate capture and control, nor does it discuss the feasibility or safety of modifying a marine terminal structure to accommodate the Ship Emissions Control Technologies (SECT) system. In fact, AEG expressed concerns about the SECT system being able to handle changes in flow rates during tanker loading and unloading, and about its current inability to accommodate tanker spark arrestor designs with existing technology. AEG also stated that vessel-specific coupling devices would need to be created for each individual ship, spark arrestor and stack diameter, but has not proposed how this could be done by the now-accelerated deadlines in the 15-Day Changes (for reference, approximately 200 unique vessels call on RLW in a three-year period).
- The Coalition for a Safe Environment’s December 5, 2019 presentation focuses on the barge-based only Advanced Maritime Emissions Control System (AMECS) which has been utilized for container ship applications in POLA/POLB. The Coalition has not presented any evidence that AMECS has been designed and applied to tankers, which would require a system significantly larger than the current AMECS system. Further, during CARB staff’s At Berth Working Session on April 15, 2019, the AMECS representative indicated their significant concerns with the interface with tankers from design (scale-up), timing, operability, and safety standpoints. Additional inaccuracies in the Coalition presentation are detailed in Tab 14 to this letter.

49-19  
cont.

49-20

In any event, CARB staff have admitted that these accelerated deadlines will “result[] in higher costs for vessel and terminal operators” (Notice, App. B, p. B-1), but have not demonstrated that these new deadlines can be safely or feasibly achieved by tanker terminals by 2029/2027, let alone by two years sooner. These substantial changes also will require an updated SRIA and health risk assessment. Adopting the 15-Day Changes without a proper determination of feasibility, safe operation and cost-effectiveness before any requirements or deadlines are imposed on regulated parties would violate the California Health & Safety Code. Moreover, the accelerated deadlines proposed in the 15-Day Changes cannot legally be justified as “technology-forcing” regulations, since CARB staff have provided no evidence in the administrative record indicating that at berth capture and control for tankers is reasonably anticipated to exist, or likely to become feasible or cost-effective, by the compliance deadlines. CARB bears the burden of establishing that a proposed regulation can be feasibly and cost-effectively implemented in the timeframes required by the regulation. CARB has failed to meet its burden here, and the available evidence WSPA and others have provided indicates a lack of any evidence that capture, and control can be safely and feasibly implemented for tankers in the timeframes required. We again strongly urge CARB to conduct a feasibility study for tankers, as described in our March 6<sup>th</sup> letter, and publish its analysis and findings in a report before any terminal plan deadlines are enforced.

D. The Draft EA Must Be Revised and Recirculated to Analyze the Environmental Consequences of Accelerated Compliance Deadlines As Required By CEQA

49-21

Regarding CEQA compliance, the 15-Day Notice asserts that the proposed revisions to the regulatory text “do not change implementation of the regulation in any way that affects the

conclusions of the Draft Environmental Analysis ... so no additional environmental analysis or recirculation of the analysis is required”; and that accelerating the implementation deadlines for tanker vessels “would not change the nature or extent of physical changes to the environment; it would simply result in them occurring ... two years sooner.” Notice, pp. 33-34.

However, the cursory and conclusory “Environmental Analysis” included in the Notice, consisting of little more than two pages (*id.*, pp. 33-35), provides no support for these claims. Instead, CARB staff ignore potentially significant impacts on the physical environment associated with the accelerated compliance deadlines in the revised proposal. The Draft Environmental Analysis (“Draft EA”) must be revised and recirculated to disclose and allow additional public comment on the substantially more severe environmental impacts that may result from the regulatory revision. See *also* Chevron’s comments on the 15-Day Changes submitted on April 30, 2020, which address CEQA issues associated with the 15-Day Changes in greater detail. WSPA concurs with and incorporates Chevron’s comments by reference.<sup>3</sup>

49-21  
cont.

- First, as discussed above, the 15-Day Changes increase the risk of a hazardous incident such as a fire or explosion from early deployment of untested technology. The impacts on human health and safety resulting from such a hazardous incident are literally a matter of life and death. A hazardous incident also poses the threat of an oil spill, which could significantly impact the aquatic environment and the species who use or interact with that environment. As explained in WSPA’s December 3, 2019 comments on the Draft EA, the document failed to disclose, let alone analyze, the serious health and safety and environmental risks associated with requiring emissions capture systems on tanker vessels. While such systems have been tested on container ships, they have not been designed, tested and proven safe for use on tankers. The “Environmental Analysis” in the 15-Day Notice fails to consider or even mention the potential for accelerated compliance deadlines for tanker vessels to exacerbate the risk of significant hazard impacts.

49-22

As discussed at length in our prior comments, including those on the Draft EA, tanker vessels are different from container vessels and pose unique safety considerations due to larger boilers and the need to handle flammable cargoes. Numerous important safety systems are required for proper handling of these flammable cargoes to prevent a hazardous incident from occurring. One such system is the use of inert gas to reduce the oxygen content in the tanker vessel’s cargo hold in order to ensure that flammable vapors

---

<sup>3</sup> The 15-Day Notice (p. 37) also references three additional documents newly added to the administrative record which “helped inform staff’s opinion that there are technology solutions already available for improving shore power connections and also on-board solutions to reducing emissions from vessels at berth.” The Draft EA finds that land-based capture and control systems constitute the reasonably foreseeable means of compliance for tanker vessels (Draft EA, pp. 9-10, 22). In these comments and in WSPA’s previous comments, we have relied on those statements in the Draft EA, and we assume that this remains the case. Accordingly, the three additional documents on shore power and “on-board solutions” appear to be irrelevant to the feasibility of compliance for tanker vessels. If CARB staff wish to change the reasonably foreseeable means of compliance for tanker vessels – which provide the basis for environmental analysis of the Proposed Regulation (see CEQA Guidelines Section 15187) – the Draft EA would need to be revised to consider a different set of potentially significant impacts (including those associated with increased electrical power demand at terminals, new safety concerns raised by potential sparking sources from new wiring infrastructure on vessels, and new environmental and safety impacts from requiring different types of construction in different locations), and recirculated for additional public comment before it can be finalized.

49-23

are not ignited. The Proposed Regulation would require modifications to inert gas safety systems and other vital safety systems used at tanker terminals. However, currently there is no technology that has been shown to be safe and feasible for the stack capture and control for tanker vessels that would be needed for compliance with the regulation. The accelerated 2027 deadline introduced in the 15-Day Changes renders this problem even more acute. By increasing the likelihood that the compliance date will arrive before technical solutions are available to ensure that the new regulatory requirements will not compromise vitally needed safety systems, the 15-Day Changes increase the risk of hazardous incidents with potentially more severe impacts to human health and safety, both at the facility and in the surrounding community. Moreover, the increased risk of hazardous incidents also has the potential to harm wetlands and other sensitive habitats in the vicinity of tanker terminals, resulting in more severe impacts to biological resources.

49-23  
cont.

- Second, CARB staff have not adequately evaluated impacts to biological resources, wetlands and other sensitive habitats resulting from the suite of construction projects along the shorelines that would be required to comply the Proposed Regulation, which would need to be accomplished within the accelerated deadlines of the proposed 15-Day Changes. In particular, CARB staff have not evaluated the impacts or feasibility of forcing regulated facilities to conduct construction activities rapidly to meet the advanced deadlines, while at the same time adhering to seasonal work windows designed to protect fish species. WSPA’s December 2019 comments explained the deficiencies in the biological analysis in the Draft EA, and the proposed 15-Day Changes would make these deficiencies worse, by intensifying the impacts on a variety of special-status aquatic and shoreline species that CARB staff have yet to evaluate.

49-24

- Third, CARB staff have not evaluated cumulative impacts, including impacts to biological resources and other CEQA impact categories, in light of its proposed 15-Day Changes. The Notice contains one paragraph that purports to assess cumulative impacts, but this inadequate discussion does not in fact address cumulative impacts as defined by CEQA; that is, environmental impacts of other past, present and reasonably foreseeable future projects together with those of the proposed project (CEQA Guidelines 15355). Rather, the Notice states: “CARB staff do not anticipate this change [acceleration of the compliance deadlines] to have a large potential to cause cumulative impacts from other marine-related construction associated with this regulation, as no other compliance dates for ocean-going vessels or their related terminals are scheduled to go into effect during the new implementation years” and because “no significant construction is anticipated for ro-ro terminals.” Notice, p. 34 (emphasis added). While this text at least claims to address the prospect of overlapping construction by multiple operators subject to the Proposed Regulation, it entirely disregards cumulative development that is not “associated with this regulation”—namely, past, present and reasonably foreseeable future residential, commercial, and industrial development along the shoreline and maritime projects occurring in bays and waterways. See also the discussion above of hazard impacts including risks to human life and past incidents.

49-25

The altered deadlines of the 15-Day Changes not only compress and potentially intensify the severity of impacts from construction activities at facilities subject to the Proposed Regulation, but would also affect the interaction with impacts of other past, present and reasonably foreseeable cumulative projects in the shortened compliance timeframe. See, e.g., Chevron’s April 30 comments for some examples of specific cumulative projects which should be considered in such analysis.) As such, CARB staff’s cursory statement

fails to provide the cumulative impacts analysis required by CEQA, instead improperly limiting its assessment to impacts that would occur only under CARB's own rule. | 49-25  
cont.

- Finally, the bullets above are only examples of project-level and cumulative impacts that can be expected to become substantially more severe as a result of the accelerated deadlines. Rather than a dismissive and unsupported blanket assertion that the compressed implementation schedule “would not change the nature or extent of physical changes to the environment; it would simply result in them occurring ... two years sooner” (Notice, pp. 33-34), CARB should re-examine each of the impacts determined to be potentially significant in the Draft EA in light of the 15-Day Changes. | 49-26

CARB staff must revise and recirculate the Draft EA to evaluate the heightened hazards and impacts to biological resources resulting from the Proposed Regulation and the 15-Day Changes accelerating the already-unrealistic compliance deadlines, and to conduct a proper project-specific and cumulative analysis of all categories of impacts caused by construction activities associated with the Proposed Regulation together with impacts on the same resources from construction of other, unrelated cumulative projects. These are serious omissions of crucial impact analyses required by CEQA, which must be disclosed in a recirculated Draft EA and on which stakeholders are entitled to comment, before CARB may adopt the Proposed Regulation. | 49-27

#### V. The “Innovative Concepts” Provisions in the 15-Day Changes Do Not Provide a Compliance Alternative to Regulated Parties

Another major change proposed in the 15-Day Changes would allow the use of certain “Innovative Concepts” to meet compliance obligations. CARB staff present the “Innovative Concepts” provisions as “an alternative compliance pathway,” and claim that the new provisions are proposed “in response to numerous comments received by industry members and ports.” Notice, pp. 4, 20. **WSPA did not request these “Innovative Concepts” provisions.** WSPA was very clear in its March 6, 2020 letter to CARB about the changes that would be needed to implement a compliance alternative in lieu of at berth capture and control. The proposed “Innovative Concepts” provisions bear no resemblance to WSPA’s proposed alternative compliance option.

As CARB staff have conceded, the provisions in question would not actually provide a functional “alternative” to compliance with at berth control and capture requirements. Rather, as envisioned by CARB staff, most or all regulated parties seeking to use the “Innovative Concepts” provisions will find themselves forced into compliance with the default at berth control requirements anyway, typically after only six years. See Notice of 15-Day Changes, Attachment B, Summary of Proposed 15-Day Changes and Impacts on Costs: Control Measure for Ocean-Going Vessels At Berth, p. B-3 (“staff assume a six-year period for use of an Innovative Concept in the cost analysis”). But even this CARB assessment of a six-year usage period is overly optimistic. The “Innovative Concepts” provisions contain several significant limiting conditions, which strongly disincentivize funding by stranding investment and creating significant compliance risks. By structuring the “Innovative Concepts” provisions in this way, CARB essentially conveys that the only acceptable compliance option is control of at berth emissions.

Regulated parties would need to repeatedly apply for and receive CARB approval to use an “Innovative Concept” for limited three-year terms, would need to prove that the proposed reductions will be in excess of future “business-as-usual” emissions, and would be subject to denial of renewal if CARB or an approved local AB 617 community emissions reduction plan later mandates the reduction. According to the Notice (p. 21), “[T]he three year time period is expected

to be long enough to allow the applicant a window of certainty for compliance with the rule but short enough to ensure that an innovative concept is still achieving early or excess emissions reductions.” On the contrary, the 15-Day Changes provide no such “window of certainty”, since approval of an Innovative Concept may be revoked with no more than a 30-day notice, or may even become ineffective without revocation and on no notice, at any time. See 15-Day Changes, Proposed Sections 93130.17(f) and (g).

The “Innovative Concepts” provisions in the 15-Day Changes would require participating marine terminals, by December 1, 2021, to submit an application for approval of a proposed emission reduction as an “Innovative Concept.” The proposed reduction must meet a host of requirements. The proposal would need to reduce annual oxides of nitrogen (NOx), fine particulate matter (PM2.5) and reactive organic gases (“ROG”) emissions by an amount at least equal to the level that would have been achieved by implementing the Proposed Regulation’s at berth capture and control requirements. These reductions may only occur at the marine terminal or “within adjacent communities,” or overwater within three nautical miles of the terminal. They must be in excess of any reductions already required by any legal requirement or emission reduction strategy identified in any AB 617 Community Emission Reduction Plan, and they must also “exceed any reductions that would otherwise occur in a conservative business-as-usual scenario” (defined as those conditions reasonably expected to occur in the future in the relevant area without the “Innovative Concept” emission reduction, accounting not only for current laws and regulations but also “current economic and technological trends.”). See Notice, Attachment A, at A-57 (proposed 17 C.C.R. 93130.17(a)). As to this last requirement, the 15-Day Changes are silent as to how “business-as-usual” conditions would be determined to set a realistic baseline emissions inventory.

Far from being a true “alternative” to main-line compliance, as CARB staff conceded at the December hearing, the “Innovative Concepts” provisions would only provide a temporary delay of the inevitable need to install capture and control at marine terminals. Any “Innovative Concept” would only be approvable for maximum three-year terms, and CARB could revoke or decline to renew approval (in its unreviewable discretion) if the emission reduction at issue were to become mandated by regulation or by any CARB-approved AB 617 Community Emission Reduction Plan, or if CARB were to decide that the “business-as-usual” trend eventually would have resulted in the reduction anyway.<sup>4</sup> See *id.* If an “Innovative Concept” were to be revoked or renewal denied, a regulated marine terminal could be in imminent or immediate noncompliance, with no identifiable feasible path to compliance for tanker vessels. This would result in a continuously moving compliance target that will inevitably end in noncompliance. Once an “Innovative Concept” approval is revoked or renewal is denied, the terminal will have to identify and develop new “Innovative Concept” projects to avoid being required to install infeasible capture and control equipment. Even if a new “Innovative Concept” were identified, the 15-Day Changes provide no defined period of time to design, permit and implement it. Eventually, the pool of reasonably available reductions that could qualify as an “Innovative Concept” will be exhausted, leaving the terminal unable to avoid noncompliance. Ironically, the proposed “Innovative Concept” provisions would actually **stifle** innovation, as few terminals would commit the engineering, permitting,

---

<sup>4</sup> CARB staff’s “Summary of Proposed 15-Day Changes and Impacts on Costs” also assumes that the average approved “Innovative Concept” would only remain in place for six years, as CARB staff expect future regulations to require many of the types of reductions regulated facilities would seek to use as an “Innovative Concept.” See Notice, Att. B, p. B-3.

construction timelines, capital and manpower needed to develop an “Innovative Concept” if it eventually will become a stranded investment.

With any proposed “Innovative Concept” emissions reductions limited to maximum three-year terms, and subject to revocation or non-renewal at any time if and when CARB, any other government agency, or an AB 617 community decides to simply require them (as CARB expects is likely to happen), regulated marine terminals could not rely on an “Innovative Concept” as a true “alternative” to compliance with at berth capture and control requirements. While CARB staff assume that terminals would make use of the “Innovative Concept” provisions, as proposed, those provisions offer little incentive for companies to make significant investments in emissions reductions that would provide, at best, only temporary relief from the primary at berth capture and control requirements.

The “Innovative Concept” provisions also suffer from several other deficiencies that limit their usefulness to regulated parties and disincentivize their use:

- Regulated parties should not be immediately disqualified from using an “Innovative Concept” and required to provide new reductions if the “Innovative Concept” becomes regulated. This contradicts the principle under California law that emission reduction credits must be real, permanent, quantifiable, enforceable and surplus at the time they are initially generated, based on the laws and regulations then in effect. See Cal. Health & Safety Code 39607.5; 17 C.C.R. 91501(i). Emissions credits are not retroactively disqualified, or new reductions required, if some of those credited reductions become regulated at some point in the future. Indeed, the 15-Day Changes would not retroactively require new reductions from regulated sources if future federal regulations achieve the emissions savings of the At Berth Regulation. Moreover, any other at berth CARB Approved Emission Control Strategy (CAECS) would involve a one-time operator investment resulting in a certain and creditable emissions reduction at the terminal or port. We would urge CARB staff to remove this unnecessary disparity between the CAECS compliance option and the proposed “Innovative Concept” provisions, and at least harmonize the “Innovative Concept” provisions to allow a more certain and permanent alternative to compliance with capture and control. At the very least, CARB staff should ensure that “Innovative Concept” reductions that were not already legally required at the time of their approval do not lose their “Innovative Concept” status if they later become legally required.
- The proposed “Innovative Concepts” language in the 15-Day Changes also would create a fundamental unfairness to regulated parties funding early and ongoing emissions reductions (e.g., funding early replacement of tugboat engines) by ultimately crediting the future-regulated source with the benefit of those reductions, rather than the regulated party who originally paid for the reduction. It is beyond question that early funding of emissions reductions not currently required by law reduces the future emissions baseline, which then allows less burden to be placed on other sources in the inventory for reductions. This conflicts with the way CARB has addressed early reductions in other contexts such as AB 32, where early reductions were immediately credited to the party funding them regardless of whether those reductions eventually became required by law.
- The 15-Day Changes would require emissions reductions from an “Innovative Concept” to be annually reported and compared to reductions that would be achieved from controlling at berth emissions through capture and control. This essentially imposes an

ever-changing annual mass emission reduction requirement, based on terminal activity (and requires a difficult assessment of what “business-as-usual” activity would have been without the “Innovative Concept”). In contrast, a CAECS does not need to meet an annual mass reduction requirement, but simply requires the source to achieve a control requirement that is independent of source activity. An “Innovative Concept” should be held to the same CAECS standard and only require implementing a control requirement that is independent of source activity, rather than being held to a changing annual mass emissions target.

- Permanent reductions should not require a reapplication for qualification every three years, given that the annual verification process will already confirm that those reductions are real, permanent, quantifiable, enforceable and surplus.
- Limiting the location of “Innovative Concept” emissions reductions only to “adjacent” communities may have unintended consequences. Neither “adjacent” nor “community” are defined in the Proposed Regulation, so it is unclear how close an area would need to be in order to be deemed “adjacent,” and where the boundaries of that area would end. Reductions in an “adjacent” nearby community impacted by terminal-area emissions, but that is not immediately bordering the port or terminal, could be needlessly excluded (even if they benefit that area). Also, a nearby AB 617 community may not be sure how to account for emissions reductions from “Innovative Concept” projects, and whether such reductions would need to be required by its Community Emissions Reduction Plan. WSPA recommends changing this criterion to “within five miles of the terminal or port,” in order to eliminate the ambiguous term “adjacent community” and strike a reasonable balance between distance from the terminal/port and a large enough area from which emissions reductions could still benefit communities affected by terminal/port-area emissions.
- Limiting qualifying reductions from tankers to distances no greater than 3 nautical miles from a port or terminal is unnecessary and conflicts with the benefits accounted for within the much larger area defined by CARB’s Fuel Sulfur And Other Operational Requirements For Ocean Going Vessels Within California Waters And 24 Nautical Miles of the California Baseline (13 Cal. Code Regs. § 2299.2) (Fuel Sulfur Regulation). The air basins defined in the Fuel Sulfur Regulation are nearly identical to those designated in the Health Risk Assessment (HRA) for the Proposed Regulation.<sup>5</sup> CARB staff should allow PM, NO<sub>x</sub> and ROG reductions in the wider area defined by the Fuel Sulfur Regulation to also qualify for credit as an “Innovative Concept.”
- The inability to obtain approval for an alternative reduction funded partially with public incentives does not make practical sense. CARB directed staff to craft an Innovative Concept option that “meets or exceeds” reductions from compliance with the Proposed Regulation. Under that rationale, even if a regulated facility decides to apply public incentive funds to partially fund an Innovative Concept, those emissions reductions should be credited if they would not have happened but for the offer of coverage as an “Innovative Concept,” and exceed the reductions that would have been achieved through complying with the capture and control requirements of the Proposed Regulation.
- The 15-Day Changes would require that reductions from an “Innovative Concept” be calculated using the actual data evidencing that reduction (i.e., a “business-as usual”

---

<sup>5</sup> <https://ww3.arb.ca.gov/regact/2008/fuelogv08/appe2fuel.pdf>

emission baseline minus the actual emissions under the “Innovative Concept”). But the proposed regulatory language would then compare those “Innovative Concept” reductions to at berth emissions derived from default emission factors. This is an unnecessary disparity in emissions estimation methods and using default emission factors to estimate at berth emissions does not account for voluntary upgrades to vessel emission sources. To remedy this disparity, the proposed section 93130.17(d)(1)(B) should allow the option to calculate at berth emission reductions using best available information rather than mandating use of emission factors.

- The proposed December 2021 deadline for any “Innovative Concept” to be included in Port/Terminal Plans is too soon for regulated parties to have any meaningful plan for such proposed reductions ready, given the uncertainties listed above. It is also inconsistent with language in the Notice specifying that “[a]pplications for innovative concepts are due on or before terminal plan and port plan due dates,” given that proposed Section 93130.14(a)(2) provides that final revised terminal plan submittals are not even due until 2024 for ports and 2026 for all other tanker terminals. The 2021 “Innovative Concept” deadline should be changed to match the deadlines for revised terminal plans in Section 93130.14(a)(2).
- The “Innovative Concept” provisions also should clearly provide that port and terminal operators with an approved terminal plan containing an “Innovative Concept” or other CAECS should be entitled to rely on that approved “Innovative Concept” or CAECS completely for compliance with the Proposed Regulation, and not **also** be required to rely on another compliance option (such as the remediation fund option) during the time that the “Innovative Concept” is being constructed and implemented. Failing to clarify these risks unfairly penalizing entities that receive approval for and commit in good faith to a valid CAECS or “Innovative Concept,” either of which could take upwards of a decade to complete
- WSPA recommends CARB staff further revise the “Innovative Concepts” in the 15-Day Changes to reflect the proposal in WSPA’s March 6, 2020 comment letter, specifically the key provisions addressing how reductions from an “Innovative Concept” are determined to be equivalent, where they can occur, and which regulations they need to be in excess of.
  - WSPA’s proposal for a one-time demonstration of equivalent reductions between an “Innovative Concept” and CAECS using a 2016 baseline year is superior to the proposed 15-Day Changes language because:
    - The proposal uses ARB’s 2016 baseline (or an alternative subject to ARB approval), which was the foundation for determining an acceptable amount of annual reductions from the Proposed Regulation.
    - By having a one-time equivalency comparison, the regulated community would be afforded compliance certainty to incentivize investment.
    - By having an ongoing annual demonstration that emission reduction measures are in place and properly operating, there would be assurance that emission reductions are occurring.

- Like CAECS, WSPA's proposed language imposes a compliance requirement on an "Innovative Concept" that is independent of source activity, ensuring that an "Innovative Concept" is not chasing a changing annual mass emissions target.
- WSPA's proposal to allow calculation of uncontrolled at berth emissions using best available information avoids the inaccuracy of the default emissions factors mandated by proposed Section 93130.5(d)(1)-(2) in cases where vessel operators have voluntarily upgraded ship engines to cleaner engines.
- WSPA's proposal to at least allow reductions from Innovative Concepts to occur within five miles of the port/terminal and within California waters, if not within 24 nautical miles as discussed above, is superior to the language proposed in the 15-Day Changes. A five-mile limit strikes a balance between distance from the terminal/port and a large enough area from which to achieve emissions reduction. A fixed distance also recognizes that air quality benefits can change with meteorology and are not bound by "community" or city boundaries.
- WSPA's proposal to require reductions from "Innovative Concepts" to be specifically in excess of United States law and regulations is superior to the language proposed in the 15-Day Changes. Operators in California are presumed to be familiar with United States federal and state laws and regulations, but are not always versed in the international regulations that may apply at various ports of all throughout the world (especially if the vessels do not normally call on those ports). In setting the emission reduction requirements for CAECS, CARB staff have not disallowed emissions reductions that might be required by international regulations; it is sufficient if such reductions are not already required under United States federal or state laws or regulations.

#### **VI. The Amended "Interim Evaluation" Provisions Still Do Not Provide Any Relief for Regulated Parties and Do Not Meet CARB's Obligation to Prove Feasibility Before Imposing Regulatory Requirements**

The 15-Day Changes also propose amendments to the requirement that CARB staff conduct an "interim evaluation" of new control technologies, accelerating the deadline for that evaluation by six months to December 1, 2022 and specifically requiring review of "the information provided by the port and terminal plans" and "other public information provided to CARB including terminal specific engineering evaluations, logistical considerations, public engagement, and independent studies that inform the implementation timeline." See Notice, Att. A, p. A-46 (proposed 17 C.C.R. 93130.14(d)).

Even as amended, however, the "interim evaluation" provision is no substitute for conducting a proper feasibility study before mandating a control strategy, not after. These amendments do nothing to relieve facility operators of the Proposed Regulation's infeasible emissions reduction requirements, and they still do not require CARB to conduct the feasibility study necessary to assess the safety and feasibility of installing the very capture and control systems required by the Proposed Regulation. In our March 6, 2020 comment letter to the Board, WSPA reinforced the need for a proper feasibility study for stack capture and control systems on tankers, and proposed redlines that described the minimum elements that should be required as a part of any proposed

“interim evaluation.” Still, with or without an “interim evaluation” **after** adoption of the Proposed Regulation, a feasibility study is still needed **before** any regulation is adopted, and likely would take approximately three years. With the now-accelerated deadline of December 2022 for an interim evaluation, there is no way that interim evaluation could possibly be informed by a full and complete feasibility study or could itself seriously evaluate potential technological feasibility concerns created by the Proposed Regulation.<sup>6</sup>

Indeed, some Board members have made clear that they do not view the “interim evaluation” provisions as **any** serious restriction on proceeding rapidly with the Proposed Regulation. In responding to a discussion by Board member Gioia about the importance of the interim evaluation to stakeholders, Chair Nichols replied that “by signaling that we’re going to do a review in 2023, are we incentivizing people to just not do anything until 2023? . . . That would be obviously the wrong direction to go in . . . So I hope we have some understanding of what exactly is going to start to happen the minute this gets underway.” These statements illustrate the Governing Board’s and CARB staff’s understanding of the interim evaluation as a separate opportunity for **additional** future regulation of at berth activity, not as a limit on the proposed standards already in the rule.

Moreover, the 15-Day Changes now also allow CARB staff to recommend the Board either defer or *advance* compliance deadlines “backward or forward in time” based on the findings of the interim evaluation. See 15-Day Changes, Proposed Section 93130.14(d). Though there is little risk that a full and fair evaluation would support advancing the deadlines still further, with an even shorter compliance period remaining, the inclusion of this language eliminates any “window of certainty.”

## VII. The 15-Day Changes to the Proposed Regulation’s CAECS Provisions Fail to Address the Counterproductive “Grid-Neutral” Requirement

Finally, the “grid-neutral” provisions in proposed Section 93130.5(c) and (d) in the 15-Day Changes would impose unnecessary new requirements on any CAECS requiring provision of power. Some terminal operators currently draw power from a combination of grid and on-site cogeneration power. To meet the proposed “grid-neutral” requirement, these operators would need to isolate the power supply for the CAECS to pull directly and **only** from the grid, which adds unnecessary project complexity and is not a cost-effective way to reduce GHG emissions.

WSPA believes the grid-neutral requirement in the proposed 15-Day Changes is unnecessary. A market-based incentive to reduce GHG emissions from a CAECS already exists through the Cap-and-Trade Program, and the value of auctioned allowances is used by the state to further mitigate GHG emissions that might be generated by a CAECS. Additionally, a grid-neutral requirement drives facilities away from on-site cogeneration, which puts facilities at greater risk from Public Safety Power Shutoff events (which tend to drive facilities towards on-site power generation). For these reasons, this requirement should be removed from the 15-Day Changes. If CARB staff are concerned about impacts from a temporary power source (e.g., diesel engines) needed to power a CAECS, the 15-Day Changes should simply specify that CAECS may not be powered by those temporary power sources of concern.

---

<sup>6</sup> In addition, the new provisions requiring CARB staff to “consider” public information and studies they receive do not create any new duty for CARB staff, and do not commit CARB staff to do anything more than report their findings to the Board and make recommendations for possible future regulatory amendments.

Clerk of the Board  
May 1, 2020  
Page 21

We apologize for the length of this 15-Day Changes comment letter, but we feel we are given no alternative due to the extensive unresolved issues in this rulemaking. Our hope was that by 1) working together through numerous meetings, 2) conducting visits to various facilities to understand the complexities, unfeasibility, and safety concerns these regulations pose, 3) providing seven sets of comment letters dating back to February of 2019 summarizing these concerns, and 4) working hard on an alternative compliance option that achieves the same emission reductions, would have yielded a different and better outcome.

CARB has historically stood on a long-standing performance-based philosophy - setting the emission reduction targets and allowing industry and business to figure out the most cost-effective and safe way to meet those targets. This regulation unfortunately deviates from this historical approach as it does not address the need for a feasibility study, poses unacceptable safety risks, picks a particular technology which is unproven, unsafe, and extremely costly which will not be available within the specified timelines, proposed at a time with what appears to be little acknowledgement of the unprecedented social and economic disruptions caused by the pandemic, and without recognizing a viable alternative pathway that industry worked hard to develop to meet the emission reductions the regulation attempts to achieve. CARB did, most recently, put forth an Innovative Concept but unfortunately it does not provide a functional alternative to compliance with at berth control and capture requirements, thus disincentivizing its use.

WSPA had hoped for a win-win solution for meeting the health goals of the communities with a performance based emission reduction pathway. We are now hopeful perhaps we can resume discussions to meet that mutual goal. Please feel free to contact me if I can provide any clarifications or answers any questions.

Sincerely,

Re: WSPA Supplemental Comments on and Suggested Red Line of CARB Proposed Control Measure for Ocean-Going Vessels at Berth

Dear Richard:

This letter supplements comments previously submitted by the Western States Petroleum Association (WSPA) on the California Air Resources Board's (CARB) Proposed Control Measure for Ocean-Going Vessels at Berth (Proposed Regulation), released October 15, 2019, and its accompanying Draft Environmental Analysis (Draft EA), released October 1, 2019. WSPA is a non-profit trade association representing companies that explore for, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California and four other western states.

WSPA is providing these comments as part of a continuing effort to provide feedback on the At Berth Regulations. We incorporate our previous comments submitted on February 15, March 29, May 30, June 14, August 15, 2019, and December 3, 2019 by reference herein.

The safety and well-being of our members' employees and the communities in which they operate is of critical importance to our members and their facilities. As you know, WSPA strongly supports CARB's air emission reduction goals and improving the air quality in communities where our members operate. We continue to have concerns, however, that the Proposed Regulation still does not adequately address potential safety and feasibility issues associated with the emissions capture and control equipment that would be required for tanker terminals. Like CARB, WSPA members feel strongly that the Proposed Regulation should not create an unacceptable risk of a catastrophic explosion or other dangerous incident.

49-28

Since workshops on the Proposed Regulation began, WSPA has documented the recognized safety and feasibility problems associated with proposed tanker emission controls, urging CARB to partner with industry to first conduct a feasibility study. WSPA has also called on CARB staff to add to the Proposed Regulation an alternative compliance option that would achieve equivalent emission reductions from other sources.

To help address these issues, WSPA is attaching to this letter a suggested redline of the Proposed Regulation that clarifies additional provisions regarding the need for a feasibility study prior to the imposition of deadlines, and an alternative compliance option that would enable a more feasible path to compliance while ensuring the health and safety of the communities in which we operate. We believe that the propose changes improve the Proposed Regulation and help ensure that any measures required for marine terminals and tankers achieve important emissions reductions in a feasible, safe and cost-effective way.

**1. Any emission control strategy for tanker vessels must first be demonstrated feasible and safe in the types of facilities and marine terminals where it is proposed.**

Tankers have unique characteristics and safety concerns that distinguish them from other marine vessels. Tankers have very large boilers necessary to drive transfers of flammable liquid cargo. Indeed, the Proposed Regulation singles out tanker boilers as the sole category of boilers to be regulated on any at-berth vessel. For these boilers, CARB staff have acknowledged in the Initial Statement of Reasons (ISOR) that “[s]hore power . . . cannot be used to power boilers, because boilers are configured to operate on electricity. As such, shore power does not reduce tanker boiler emissions.” ISOR, p. ES-23.

Additional challenges with equipping tanker vessels with shore power include adoption by the international fleet given a lack of international requirements and standards to allow for a vessel to connect, to a grid, at multiple locations. Further, the time required to “turn over” the fleet of tankers to be equipped with this capability would be extensive. Accordingly, CARB staff have concluded that the most suitable control strategy would be stack capture and control (“stack capture”).

However, attempting to control tanker boilers with stack capture introduces significant risk, including risk of explosion that precludes testing the equipment on actual tankers. CARB staff may not have considered a stack capture system on an actual tanker, but instead may have only looked at stack capture systems that are used on *container* vessels in POLA and POLB, and may have concluded that those systems would work safely and feasibly on tanker vessels because they worked on container vessels. We are concerned that this conclusion does not contemplate the unique operations and safety considerations that exist for tanker boilers, including the following:

- Tanker boilers are required by regulation to route their exhaust gas to the cargo hold, in varying amounts, to make the vapor space in the cargo hold safe from explosion. Extensive engineering studies are needed to determine if and how stack capture and control can be designed and operated without impairing this safeguard or violating existing safety regulations.
- Capturing tanker boiler exhaust gas without a properly engineered and tested control mechanism runs the risk of static electricity generation, electrostatic discharge, and creating a potential explosive condition on a vessel filled with flammable and explosive liquid.
- There are no international or domestic standards or safety guidelines specifying how a stack capture and control mechanism would be safely managed or maintained for oil tankers. The international tanker fleet consists of a large variety of ships, mostly operated by third parties, with a complex mix of boiler configurations. All types of connections and interfaces between tankers and terminals must be designed to engineering standards, rules and guidelines from regulators (USCG, Classification Societies) and industry (Oil Companies International Marine Forum (OCIMF), International Safety Guide for Oil Tankers and Terminals (ISGOTT), International Marine Organization (IMO)). The Proposed Regulation would require installation of capture and control systems on tankers with no currently available guidance on how that could be done safely or feasibly.

Thus, before any actual pilot testing can be conducted, a feasibility study needs to be conducted to fully take into account these and other operational and safety considerations, including the

49-29

need for development of rules and standards in order to design a safe interface and operational procedures for any control equipment between an oil tanker and an emissions capture system. We appreciate that CARB staff, in its staff report, have already recognized that more tests and safety studies need to be performed before attempting to use stack capture on tanker vessels, regardless of site or location. Also, as CARB staff heard from a lead technology provider in the April 16, 2019 CARB At Berth Working Session, a land-based system faces a number of design challenges when applied to any tanker vessel, including safety (a higher hazard level, need for safety standards and procedures, emergency protocols) and ability to design and operate a larger and more complex configuration. Vessel operators, mostly third-party, will not allow the connection of equipment that is not regulated, classified, and/or certified to design and safety standards recognized by regulators and industry.

49-29  
cont.

We respectfully request CARB to conduct a feasibility study before any terminal plan deadlines prior to 2023 are enforced. This feasibility study would identify the key criteria to demonstrate the operability and safety of stack capture on tankers, and require the engineering analysis of stack capture designs against these criteria prior to conducting any pilot testing program. In the attached redlined version of the Proposed Regulation, we have proposed changes that would address the need for a feasibility study. WSPA respectfully requests CARB to incorporate these redlines into a *revision of the Proposed Regulation*.

## **2. The Proposed Regulation should include an alternative compliance option to achieve equivalent emission reductions.**

During the January 30, 2020 webinar on the Proposed Regulation, CARB staff indicated that they are working on including an “alternative” compliance option to allow regulated facilities to reduce emissions from sources other than vessels at-berth. We believe such an “alternative” option must provide sources a way to to achieve similar emissions reductions to those anticipated by the Proposed Regulation, but through alternative methods *in lieu of* those capture and control requirements specified in the Proposed Regulation.

If an alternative compliance option can reduce emissions in communities adjacent to ports in an amount equivalent to the Proposed Regulation and by the currently proposed timelines, then the intent of the Proposed Regulation should be fulfilled, and there should be no additional requirements or limitations imposed on the alternative emission reductions.

In the attached redlines to the Proposed Regulation, WSPA has suggested revisions that would incorporate a workable example of the alternative compliance option described above. If available, an alternative emission reduction option would allow operators the ability to achieve the same air quality objectives as those targeted by the standards in the Proposed Regulation, in the same timeframe or earlier. It is important that operators be given the ability to achieve the same air quality objectives through alternative means, given the differences between operators, berths, etc.

WSPA commends CARB’s important ongoing work to identify and achieve real-world health benefits from feasible and cost-effective emissions reduction measures in communities impacted by air pollution. Those health benefits simply will not be achieved if proposed regulations are not feasible, and further dangerous risks of harm from fire or explosion could be created if the regulation proceeds forward without properly assessing the safety of the proposed requirements. Because California law requires a formal feasibility determination before a regulation is adopted, WSPA again respectfully requests staff to reassess the Proposed Regulation, provide for a

Mr. Richard Corey  
March 6, 2020  
Page 4

feasibility evaluation study before imposing any enforceable requirements on stakeholders, and revise the regulatory implementation in accordance with the findings of the feasibility evaluation study.

WSPA appreciates this opportunity to comment on the Proposed Regulation and strongly supports CARB's air emission reduction goals and improving the air quality in communities where our members operate. We appreciate the ongoing dialogue with you and staff on safety and other key feasibility issues associated with the emissions capture and control system that would be required for tanker terminals.

If you have any questions, please contact me at this office.

Sincerely,

**APPENDIX A [Official] PROPOSED**

**REGULATION ORDER**

Amend title 13, division 3, chapter 5.1, section 2299.3; and title 17, division 3, chapter 1, subchapter 7.5, section 93118.3; California Code of Regulations (CCR), and

Adopt new title 17, division 3, chapter 1, subchapter 7.5, sections 93130-93130.20, CCR, to read as follows:

(Note: The proposed amendments to title 13, section 2299.3 and title 17, section 93118.3 are shown in underline to indicate additions and ~~strikeout~~ to indicate deletions from the existing regulatory text. The symbol “\*\*\*” means that intervening text not amended is not shown. The entire text of sections 93130 through 93130.20 set forth below is new language in “normal type” proposed to be added to title 17, CCR.)

**Section 2299.3. Airborne Toxic Control Measure for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At-Berth in a California Port.**

\*\*\*

(c) On January 1, 2021, section 93118.3 of title 17 of the California Code of Regulations shall be superseded by sections 93130 through 93130.20 of title 17 of the California Code of Regulations, as specified in section 93130. However, if sections 93130 through 93130.20 collectively are repealed or deemed invalid in their entirety by a final court decision, the requirements of section 93118.3 of title 17 of the California Code of Regulations shall again become operative. This subsection shall not be construed as expanding or limiting either the application or requirements of sections 93130 through 93130.20, title 17, CCR, but is intended to alert affected persons of the requirements regarding the operation of auxiliary diesel engines on ocean-going vessels at-berth in a California port and other provisions in that section.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

**Section 93118.3. Airborne Toxic Control Measure for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At-Berth in a California Port.**

\*\*\*

(b) Applicability and General Exemptions.

\*\*\*

(4) On January 1, 2021, this section 93118.3, and section 2299.3 of title 13 of the California Code of Regulations, shall be superseded by sections 93130 through 93130.20 of title 17 of the California Code of Regulations, as specified in section 93130. However, if sections 93130 through 93130.20 collectively are repealed or deemed invalid in their entirety by a final court decision, the requirements of section 93118.3 of title 17 and section 2299.3 of title 13 of the California Code of Regulations shall again become operative. This section shall not be construed as expanding or limiting either the application or requirements of sections 93130 through 93130.20, title 17, CCR, but is intended to alert affected persons of the state's requirements regarding ocean-going vessels, ports, terminals, berths, and emission control strategies for ocean-going vessels.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130. Control Measure for Ocean-Going Vessels At Berth.**

The Control Measure for Ocean-Going Vessels At Berth is set forth in sections 93130 through 93130.20, title 17, California Code of Regulations, and is referenced as the "Control Measure" within those sections.

On January 1, 2021, the requirements of this Control Measure shall supersede the requirements of section 93118.3 of title 17 and section 2299.3 of title 13 of the California Code of Regulations. However, the reporting and recordkeeping requirements of section 93118.3 (g) of title 17 shall remain in effect for compliance years through 2020. The annual statements of compliance for 2020 in section 93118.3 (g)(1)(A)(2) and (g)(2)(A)(3) are still due to the Executive Officer on March 1, 2021. Annual wharfinger data from the ports under section 93118.3 (g)(3) is still due to the Executive Officer on April 1, 2021. Compliance records in section 93118.3 (g)(1)(B), (g)(2)(B), and (g)(3)(B) are still required to be maintained for 5 years, through December 31, 2025.

As specified in section 93130.20, the individual provisions in this Control Measure are severable. However, if sections 93130 through 93130.20 collectively are repealed or deemed invalid in their entirety by a final court decision, the requirements of section 93118.3 of title 17 and section 2299.3 of title 13 of the California Code of Regulations shall again become operative.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.1. Purpose and Intent.**

The purpose of this Control Measure is to reduce oxides of nitrogen (NOx), reactive organic gasses (ROG), particulate matter (PM), diesel particulate matter (DPM), and greenhouse gas (GHG) emissions from ocean-going vessels while docked at berth at California ports. This Control Measure also ensures that

ocean-going vessels do not create excess visible emissions. California’s ocean-going vessel operations are largely situated in and around at-risk communities that directly benefit from localized reductions of NOx and PM. This contributes to meeting community health goals set forth in Assembly Bill 617 (Garcia, Stats. 2017, ch. 136). Furthermore, NOx and PM emission reductions contribute to meeting California’s State Implementation Plan obligations for attainment, and further CARB’s obligations under sections 39660 et seq. and 43013 et seq. of the Health & Safety Code. Additionally, reductions from shore power have a benefit of reducing GHG emissions. This contributes to meeting California’s GHG emission reduction targets established in Assembly Bill 32 (Nunez, Stats. 2006, ch. 488) and Senate Bill 32 (Pavley, Stats. 2016, ch. 249).

The intent of this Control Measure is to ensure that emissions from ocean-going vessels are reduced using a California Air Resources Board (CARB) approved emission control strategy to control PM, NOx, and ROG emissions at berth without increasing overall GHG emissions from this Control Measure, and that every ocean-going vessel meets visible emission standards at berth and at anchor. All parties necessary to achieving emission reductions from ocean-going vessels at berth have responsibilities and requirements under this Control Measure including but not limited to vessel operators, terminal operators, ports, and operators of CARB approved emission control strategies.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

(b) Definitions.

The definitions in Health and Safety Code sections 39010 through 39060 shall apply to this Control Measure, except as otherwise specified in this section.

- (1) “Alternative Control Technologies” means technologies, techniques, or measures that reduce the emissions of NOx, PM, ROG, or GHG from an auxiliary engine and/or tanker auxiliary boiler other than shutting it down and operating on shore power.
- (2) “Anchorage” means a vessel’s allotted place to moor in place or drop anchor in California waters.
- (3) “Applicant” means any person who requests an approval from CARB for an emission control strategy.
- (4) “Application” means a formal request from an applicant using the process outlined in section 93130.5 of this Control Measure.
- (5) “Articulated Tug Barge” means a tanker barge that is mechanically linked with a paired tug that functions as one vessel. For the purposes of this Control Measure, articulated tug barges are not considered ocean-going vessels.
- (6) “Auxiliary Boiler” means a steam generator on an ocean-going vessel designed primarily to provide steam for uses other than propulsion or pumping cargo.

- (7) “Auxiliary Engine” means an engine on an ocean-going vessel designed primarily to provide power for uses other than propulsion, except that all diesel-electric engines shall be considered “auxiliary engines”.
- (8) “Berth” means a vessel's allotted place at a wharf, pier, or dock. This does not include anchorages such as at the off-shore tanker terminal at El Segundo, or where passenger vessels tender at anchor such as at Santa Barbara, or Catalina.
- (9) “Bulk Vessel” means a self-propelled ocean-going vessel constructed or adapted primarily to carry unpackaged dry bulk cargo. A bulk vessel may use vessel-based or shore-based equipment for loading and discharging of cargo.
- (10) “Calendar Year” means the time period beginning on January 1 through December 31 of a single year.
- (11) “California Ports (Ports)” means any port or independent marine terminal in California that receives an ocean-going vessel including:
  - (A) Landlord ports where the port owns the wharves which it rents or leases to a terminal operator;
  - (B) Operational ports where the port functions as a terminal operator; and
  - (C) Independent marine terminals.
- (12) “California time aggregate method” means the California State Implementation Plan method of calculating opacity emissions. The California time aggregate method is virtually identical to United States Environmental Protection Agency method 9 in the procedures the observer follows, but most notably differs in that the data is analyzed by counting the readings that exceeded the limit, rather than averaging all readings in a set.
- (13) “CARB” means the California Air Resources Board.
- (14) “CARB Approved Emission Control Strategy (CAECS)” means a method of reducing emissions from an ocean-going vessel at berth to a satisfactory level for compliance with the Control Measure and is verified and approved by CARB.
- (15) “CARB Approved Emission Control Strategy Operator” means any party who operates a CARB approved emission control strategy to reduce emissions for compliance with this Control Measure.
- (16) “Charter” or “Charter Agreement” means an agreement or contract where one person rents, leases, hires, or uses ocean-going vessels from another person to convey or transport goods or passengers to one or more designated locations.

- (17) "Charter Company" means any person that is in the business of leasing, renting, or lending ocean-going vessel(s) to other companies or persons to convey or transport goods or passengers to one or more designated locations.
- (18) "Commissioned Shore Power Vessel" means a shore power equipped vessel that visits a compatible shore power berth at a terminal and has completed vessel commissioning at that terminal.
- (19) "Container Vessel" means a self-propelled ocean-going vessel constructed or adapted primarily to carry uniformly sized ocean freight containers.
- (20) "Diesel-Electric Engine" means a diesel engine connected to a generator that is used as a source of electricity for propulsion or other uses.
- (21) "Diesel Engine" means an internal combustion, compression-ignition engine with operating characteristics substantially similar to the theoretical diesel combustion cycle. Regulating power by controlling fuel supply in lieu of a throttle indicates a compression ignition engine.
- (22) "Diesel Particulate Matter (DPM)" means the particles found in the exhaust of diesel engines, which may agglomerate and adsorb other species to form structures of complex physical and chemical properties.
- (23) "Distributed Generation" means electrical generation technologies that produce electricity near the place of use.
- (24) "Docked at Berth (at berth)" means the state of being secured to a berth.
- (25) "Executive Officer" means the Executive Officer of CARB, or his or her designee.
- (26) "Excess Emissions" means air pollution emitted by a vessel at berth during a time period when the vessel operator is required to reduce emissions, but does not achieve the full required reductions.
- (27) "Exception" means a situation that results in a compliant visit with or without emission reductions.
- (28) "First Line" means the time when a vessel's line is first attached to a berth in the process berthing the vessel.
- (29) "Fleet" means a group of vessels of the same vessel type that have agreed to utilize their combined Vessel Incident Events (VIEs) at a port or marine terminal. Vessel operators designate their fleet in the vessel visit reporting.
- (30) "Foreign-flag Vessel" means any vessel of foreign registry including vessels owned by United States citizen(s) but registered in a nation other than the United States.

- (31) "General Cargo Vessel" means a self-propelled ocean-going vessel constructed or adapted primarily to carry cargo that must be loaded individually, and that may or may not be in uniform-sized ocean freight containers. May use vessel-based or shore-based equipment for loading and discharging of cargo.
- (32) "Government or Military Vessel" means vessels operated by any branch of local, state, federal government military service, or by a foreign government, when such vessels are operated on government or military non-commercial service. This definition includes Coast Guard vessels. A commercial vessel that also carries some military cargo is not a government or military vessel unless the military is the vessel operator.
- (33) "Greenhouse Gas" (GHG) means carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrogen trifluoride (NF<sub>3</sub>), nitrous oxide (N<sub>2</sub>O), sulfur hexafluoride (SF<sub>6</sub>), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and other fluorinated greenhouse gases.
- (34) "Grid-neutral" means emitting no more GHG emissions than if the strategy were powered by the California grid as represented in the most recent eGRID Summary Table for State Output Emission Rates as the California CO<sub>2</sub>e emissions rate.
- (35) "Independent Marine Terminal" means a terminal that operates independently from a port or port authority. An Independent Marine Terminal has all the responsibilities of a terminal and a port.
- (36) "Last line" means when the time when the vessel is untied from the berth and the last line from the berth to the vessel is released.
- (37) "Lease" means a contract where one person conveys property or services to another person for a specific duration.
- (38) "Low Activity Terminal" means a terminal that has not previously exceeded the terminal thresholds in section 93130.10(a) of this Control Measure.
- (39) "Marine Gas Oil (MGO)" means any fuel that meets all the specifications for DMX or DMA grades as defined in Table I of International Standard ISO 8217, as revised on November 1, 2005, which is incorporated herein by reference, or DMX, DMA, or DMZ grades as defined in Table I of International Standard ISO 8217, as revised on June 15, 2010, which is incorporated herein by reference.
- (40) "Master" means the person who operates an ocean-going vessel or is otherwise in charge of the vessel's operations.
- (41) "Malfunction" means any sudden and unavoidable failure to operate in a normal manner by air pollution control equipment that is not caused in any way by poor maintenance, negligent operation, or any other reasonably preventable upset condition or equipment breakdown.

- (42) “Ocean-Going Vessel” means a commercial, government, or military vessel, excluding articulated tug barges, meeting any of these criteria:
- (A) A vessel greater than or equal to 400 feet in length overall as defined in 50 CFR § 679.2, as adopted June 19, 1996;
  - (B) A vessel greater than or equal to 10,000 gross tons under the convention measurement (international system) as defined in 46 CFR § 69.51-.61, as adopted September 12, 1989; or
  - (C) A vessel propelled by a marine compression ignition engine with a per-cylinder displacement of greater than or equal to 30 liters.
- (43) “Own” means having the incidents of ownership, including the legal title whether or not that person lends, or pledges an item; having or being entitled to the possession of the item as the purchaser under a conditional sale contract; or being the mortgagor of an item.
- (44) “Oxides of Nitrogen (NO<sub>x</sub>)” means compounds of nitric oxide (NO), nitrogen dioxide (NO<sub>2</sub>), and other oxides of nitrogen, which are typically created during combustion processes and are major contributors to smog formation and acid deposition.
- (45) “Particulate Matter (PM)” means any airborne finely divided material, except uncombined water, which exists as a liquid or solid at standard conditions (e.g., dust, smoke, mist, fumes, or smog).
- (46) “Particulate Matter 2.5 (PM<sub>2.5</sub>)” means any particulate matter with a diameter of less than 2.5 micrometers.
- (47) “Passenger Vessel” means a self-propelled vessel constructed or adapted primarily to carry people.
- (48) “Person” has the same meaning as set California Code, Health and Safety Code section 39047.
- (49) “Physical Constraint” at a terminal means an unavoidable barrier to provide a service due to the layout of a terminal or waterway where a state or federal public agency with jurisdiction over the resources effected by this Control Measure has made a safety determination that prevents the use of a CARB approved control strategy.
- (50) “Pilot on Board” means the vessel’s pilot has boarded the vessel to assume navigational control to prepare for vessel departure.
- (51) “Port” see California Port.
- (52) “Previously Unregulated Vessels” means container, refrigerated cargo, or passenger vessels that were part of a fleet before January 1, 2021 where the fleet did not exceed the annual visit thresholds specified in California Code of Regulations, title 17, section 93118.(b)(3)(E) for any year between 2014 and 2020 or the vessel is a steamship.

- (53) “Privately Owned United States Flag Commercial Vessel” means a vessel:
- (A) registered and operated under the laws of the United States,
  - (B) used in commercial trade of the United States,
  - (C) owned and operated by United States citizens, including a vessel under voyage or time charter to the Government, and
  - (D) a Government-owned vessel under bareboat charter to, and operated by, United States citizens.
- (54) “Reactive Organic Gases (ROG)” has the same meaning as set forth in subsection (a)(23) of section 2752 of title 13 of the California Code of Regulations.
- (55) “Ready to Work” means that the vessel is tied to the berth, the gangway has been lowered with netting down, and the United States Coast Guard, United States Customs and Border Protection, and other government authorities have cleared the vessel.
- (56) “Refrigerated Cargo Vessel” (commonly known as “reefer”) means a self-propelled vessel constructed or adapted primarily to carry refrigerated cargo. Refrigerated cargo vessels include vessels where the cargo may be stored in large refrigerated rooms within the vessel or vessels that primarily carry refrigerated cargo containers.
- (57) “Regulated California Waters” means any and all of the following:
- (A) All California internal waters;
  - (B) All California estuarine waters;
  - (C) All California ports, roadsteads, and terminal facilities (collectively “ports”);
  - (D) All waters within 3 nautical miles of the California baseline, starting at the California-Oregon border and ending at the California-Mexico border at the Pacific Ocean, inclusive;
  - (E) All waters within 12 nautical miles of the California baseline, starting at the California-Oregon border and ending at the California-Mexico border at the Pacific Ocean, inclusive;
  - (F) All waters within 24 nautical miles of the California baseline, starting at the California-Oregon border to 34.43 degrees North, 121.12 degrees West; inclusive; and
  - (G) All waters within the area, not including any islands, between the California baseline and a line starting at 34.43 degrees North, 121.12 degrees West; thence to 33.50 degrees North, 118.58 degrees West; thence to 32.65 degrees North, 117.81 degrees West; and ending at the California-Mexico border at the Pacific Ocean, inclusive.

- (58) "Remediation Fund" means an account established by a CARB-approved fund administrator under the terms of a Memorandum of Understanding with CARB to provide incentive monies to activities that achieve emission reductions, not otherwise required by law or regulation, in communities impacted by excess emissions from vessels at berth.
- (59) "Responsible Official" means any person(s) with the authority to determine the existence of emergency and safety events, and to substantiate that a vessel, terminal, port, or control equipment complies with requirements of this Control Measure.
- (60) "Responsible Party" means any person with an obligation under this Control Measure.
- (61) "Roll-On/Roll-Off Vessel" (commonly known as "ro-ro", "auto", or "vehicle carrier") means a self-propelled vessel constructed or adapted primarily to carry wheeled cargo that can be rolled on and off. Ro-ro vessels may carry exclusively automobiles (commonly known as a "pure car carrier") and/or a mixture of bulk equipment on wheels.
- (62) "Safety and Emergency Events" means an event where a responsible official reasonably determines that compliance with this Control Measure would endanger the safety of the vessel, crew, cargo, passengers, terminal, or terminal staff because of severe weather conditions, a utility event, or other extraordinary reasons beyond the control of the terminal operator or vessel operator.
- (63) "Selective Catalytic Reduction (SCR)" means an emission control system that reduces NOx emissions through the catalytic reduction of NOx in diesel exhaust by injecting nitrogen-containing compounds into the exhaust stream, such as ammonia or urea.
- (64) "Shore Power" refers to electrical power being provided by either the local utility or by distributed generation to a vessel at berth.
- (65) "Tanker Auxiliary Boiler" means a steam generator on a tanker vessel used to offload liquid product.
- (66) "Tanker Vessel" means a self-propelled vessel constructed or adapted primarily to carry liquid bulk cargo. Tanker vessels may carry petroleum crude, petroleum products, or non-petroleum based products, and are classified as either non-edible and dangerous or edible and non-dangerous.
- (67) "Terminal" means a terminal operator's facility consisting of adjacent wharves, piers, docks, other berthing locations and storage, which are used primarily for loading and unloading of passengers, cargo or material from vessels or for the temporary storage of this cargo or material on-site. Operational ports that rent a berth to vessel operators rather than lease to terminal operators shall treat that berth as a terminal.

- (68) “Terminal Incident Event (TIE)” is an exception provided to terminal operators to allow for a limited number of incidents where a vessel does not reduce emissions as required during a visit.
- (69) “Terminal Operator” means a person who leases terminal property from a port to load and unload passengers, cargo or material from vessels or for the temporary storage of this cargo or material on-site. Operational ports that use a single berth to service an individual customer are the terminal operator and the customer’s berth is a terminal.
- (70) “This Control Measure” means the Control Measure for Ocean-Going Vessels At Berth, California Code of Regulations, title 17, sections 93130-93130.20.
- (71) “Utility” shall have the same meaning and be used interchangeably with the term “Electric Utility” and means any person engage in or, or authorized to engage in, generating, transmitting, or distributing electric power by any facilities, including, but not limited to, any such person who is subject to the regulation of the Public Utilities Commission. Pub. Resource Code, section 25108 as it read on January 7, 1975.
- (72) “Utility Event” means the period of time during which any of the following events occurs; the utility event begins when such an event begins and ends when the event is over:
- (A) The utility serving the port or terminal cannot provide electrical power to the port because of a failure of equipment owned and maintained by the utility, a transmission emergency, distribution emergency, a California Independent System Operator (CAISO) or Los Angeles Department of Water and Power (LADWP) Stage 3 emergency, or the utility needs to reduce power to the port and/or terminal because of a sudden and reasonably unforeseeable natural disaster, such as, but not limited to, an earthquake, flood, or fire; or
  - (B) When the utility providing electrical power notifies the terminal operator(s) to reduce the use of grid-based electrical power in response to a transmission or distribution emergency, a CAISO or LADWP Stage 3 emergency, or to avoid a Stage 3 emergency if one is anticipated. The emergency event ends when CAISO or LADWP cancels the Stage 3 emergency or the utility notifies the terminal operator(s) that reduction in the use of grid-based electrical power is no longer necessary. The port may contact the terminal operator(s) on behalf of the utility if such an agreement exists between the utility and the port.
- (73) “United States flag Vessel” when used independently means either a United States government vessel or a privately owned United States flag commercial vessel.

- (74) “Vessel” means watercraft used, or capable of being used, as a means of transportation. For the purposes of this Control Measure, “vessel” is used interchangeably with the term “ocean-going vessel.”
- (75) “Vessel Arrival” means the date and time that a vessel is initially tied to a berth with first line.
- (76) “Vessel Commissioning” means the process undertaken by the vessel operator and terminal operator to ensure that the shore power equipment on the vessel is compatible with the shore power equipment on the terminal and that there are no safety issues for both the equipment and the personnel handling the connection.
- (77) “Vessel Departure” means the date and time that the a vessel casts off the last line.
- (78) “Vessel Incident Event (VIE)” is an exception provided to vessel fleets to allow for a limited number of incidents where a vessel operator does not reduce emissions as required during a vessel visit.
- (79) “Vessel Operator” means any person who decides where a vessel is to call or who is in direct control of the vessel. The party in direct control of the vessel may be a third-party hired to carry cargo or passengers for the person under a charter agreement to operate the vessel. Direct control does not include the vessel master or any other member of the vessel crew, unless the vessel master or crew member is also the owner of the vessel or decides where a vessel is to call.
- (80) “Vessel Owner” means any party with an ownership interest in the vessel. The owner may be an individual or multiple parties.
- (81) “Vessel Type” means a categorization of ocean-going vessels distinguished by the main cargo the vessel carries into the following types: bulk/general cargo, container, passenger, refrigerated cargo, ro-ro, and tanker vessels.
- (82) “Visible Emissions” means any particulate or gaseous matter which can be detected by the human eye.
- (83) “Visit” means the time period from when the vessel is “Ready to Work” to “Pilot on Board”.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.3 Applicability.**

- (a) General applicability.

Except as provided in section 93130.4 Exceptions, this Control Measure applies to:

- (1) any person who owns, operates, charters, or leases any United States or foreign-flag ocean-going vessel that visits a California port, terminal, or berth;
- (2) any person who owns, operates, or leases a port, terminal, or berth located where ocean-going vessels visit; and
- (3) any person who owns, operates, or leases CARB approved emission control strategy for ocean-going vessel auxiliary engines or tanker auxiliary boilers.

All responsible parties may be held jointly and severally liable.

(b) Federal requirements.

Nothing in this Control Measure shall be construed to amend, repeal, modify, or change any applicable federal regulations, including any United States Coast Guard regulations or requirements. Any person subject to this Control Measure shall ensure compliance with both federal regulations (including any United States Coast Guard regulations) and the requirements of this Control Measure, including but not limited to, where applicable, obtaining any necessary approvals, exceptions, or orders from the United States Coast Guard. To the extent any requirements in this Control Measure conflict with any applicable federal regulation, the requirements of the federal regulation shall prevail.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

#### **Section 93130.4 Exceptions.**

The requirements of this Control Measure do not apply to:

(a) Non-stop voyages.

- (1) Ocean-going vessel voyages that do not stop at a California port, terminal, or berth including:
  - (A) Stopping and anchoring required by the United States Coast Guard;
  - (B) Stopping necessary due to force majeure or distress as defined in the "Responsibility of States for Internationally Wrongful Acts (2001)", which is incorporated herein by reference; or
  - (C) A stop made solely to render assistance to persons, vessel, or aircraft in danger or distress.
- (2) The following voyages are considered a "stop" and do not qualify for the exemption:

- (A) Innocent passage of an ocean-going vessel that engages in any of the prejudicial activities specified in United Nations Convention on the Law of the Seas 1982, Article 19, subpart 2 as it read on November 16, 1994; or
- (B) The passage of vessel(s) that are otherwise scheduled or intended to call at a port or terminal facility for any reasons other than the three enumerated reasons listed in subsection (a)(1).

(b) Government and military vessels.

The requirements of this Control Measure do not apply to government or military vessels. However, government or military vessels are encouraged to act in a manner consistent, as far as is reasonable and practicable, with this section.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

**Section 93130.5 CARB Approved Emission Control Strategy.**

(a) Executive Order requirement.

No person may operate an emissions control strategy, other than shore power, at a port or terminal for compliance with this Control Measure unless it receives approval by CARB through an Executive Order. The Executive Order shall provide compliance instructions for each emission control strategy and include requirements that each responsible party must follow in order to use that strategy.

(b) Requirement to reduce emissions.

The emission control strategy must reduce emissions for vessel visits, unless:

- (1) The visit is subject to an exception in sections 93130.4, 93130.8, or 93130.10 of this Control Measure; or
- (2) The person uses a TIE or a VIE for the visit as provided in section 93130.11 of this Control Measure; or
- (3) The person pays the remediation fund payments for the visit or portion of a visit as provided in section 93130.15 of this Control Measure; or-
- (3)(4) The person has implemented emission reductions as provided in sections 93130.5(d)(7).

(c) Shore power.

Shore power is a CARB approved emission control strategy. If distributed generation is used to supply shore power, the electricity generated must meet the following emissions standards:

- (1) NOx emissions no greater than 0.03 gram per kilowatt-hour (g/kW-hr);
- (2) PM emissions equivalent to the combustion of natural gas with a fuel sulfur content of no more than 1 grain per 100 standard cubic foot
- (3) Distributed generation GHG emissions must be grid-neutral; and
- (4) Ammonia emissions no greater than five parts per million on a dry volume basis (ppmdv), if selective catalytic reduction (SCR) is used.

(d) Requirements for CARB approval of an emission control strategy.

(1) Emission Reductions

Except as provided in Section 95130.5(d)(7), Fto receive CARB approval, a person must demonstrate that the emission controls strategy achieves emission rates less than 2.8 g/kW-hr for NOx, 0.03 g/kW-hr for PM2.5, and 0.1 g/kW-hr for ROG for auxiliary engines. Additionally, for strategies approved after 2020, GHG emissions from the strategy must be grid-neutral for the year that the technology is granted an Executive Order. Default emission rates of auxiliary engines on ocean-going vessels are 13.8 g/kW-hr for NOx, 0.17 g/kW-hr for PM2.5, and 0.52 g/kW-hr for ROG.

(2) Tanker Vessels.

Except as provided in 95130.5(d)(7), Ffor tanker vessels with steam driven pumps, unless the tanker is using shore power to reduce emissions from auxiliary engines, a person must demonstrate that the CARB approved emission control strategy achieves emission rates less than 0.4 g/kW-hr for NOx, 0.03 g/kW-hr for PM2.5, and 0.02 g/kW-hr for ROG for tanker auxiliary boilers. Default emission rates of tanker auxiliary boilers on ocean-going vessels are 2.0 g/kW-hr for NOx, 0.17 g/kW-hr for PM2.5, and 0.11 g/kW-hr for ROG

(3) Already approved strategies

Where CARB has already issued an Executive Order for strategies under California Code of Regulations, title 17, section 93118 (e)(4), these are approved as a CARB approved emission control strategy. These strategies can operate under their Executive Order until 2025 before a person needs to apply for an extension in section 93130.5 (i)(1) of this Control Measure and demonstrate the strategies ability to meet all the requirements of this section including being grid neutral.

(4) SCR Strategy

Emission control strategy utilizing SCR shall have ammonia slip no greater than 5 ppmdv, and shall continuously test ammonia slip and NOx

(5) Warranty

The applicant must provide a warranty that meets the following:

- (A) The manufacturer of each emission control strategy shall warrant for 10 years when a unit is purchased that the strategy is:
    - i. Designed, built, and equipped to conform, at the time of sale, with this Control Measure; and
    - ii. Free from defects in materials and workmanship which cause the failure of a warranted part to no longer be identical in all material respects to that part as described in the manufacturer's application for certification.
  - (B) The applicant of the emission control strategy system shall provide the end user with maintenance practices set forth by the manufacturer.
- (6) When a person sells or leases a unit, the person must conduct in-use compliance testing of the strategy to demonstrate that the expected percentage of emissions reductions being achieved. The person must report the results to the Executive Officer within 30 days. If testing shows the unit does not meet the emission requirements set forth in section 93130.5 (d)(1) the unit cannot be used to satisfy the emission requirements of this regulation.

#### (7) Alternative Emission Reduction Strategy

(a) As an alternative to meeting the requirements in subsections (d)(1) and (d)(2) above, upon approval of the Executive Officer, a person subject to the requirements of this section may apply for and implement an Alternative Emission Reduction Strategy. At a minimum, the Alternative Emission Reduction Strategy must contain provisions meeting the following requirements:

- i. By no later than the compliance dates in section 95130.7(b) and 95130.7(c), the applicant shall fully implement measures to reduce NOx, ROG and PM2.5 emissions from vessels operating in Regulated California Waters and/or from onshore sources with emissions originating within 5 miles of the port or terminal.
- ii. The NOx, ROG and PM2.5 emission reductions achieved under the Alternative Emission Reduction Strategy shall be calculated as the difference between baseline year mass emissions of NOx, ROG and PM2.5 from the applicant's sources covered in the Strategy, and emissions that would have occurred from those same sources in that baseline year emissions if the Alternative Emission Reduction Strategy had been in place that year. The baseline year shall be based on best available emissions data from 2016 or a representative alternative year, subject to approval by the Executive Officer.

iii. The NOx, ROG and PM2.5 emission reductions to be achieved under the Alternative Emission Reduction Strategy must achieve either (1) no less than an 80% reduction versus baseline year emissions, or (2) reductions no less than the difference between the applicant's at-berth vessel emissions in the baseline year and at-berth vessel emissions that would have been realized that same baseline year if the applicant had met the NOx, ROG and PM2.5 emission rates in subsections (d)(1) and (d)(2).

iv. All emissions reductions to be achieved by the Alternative Emission Reduction Strategy must be real, permanent, quantifiable, enforceable and surplus to any NOx, ROG and PM2.5 reductions already required by existing U.S. law or regulation in effect as of December 31, 2016.

(e) Application process.

- (1) Before submitting an application requesting approval from CARB for an emission control strategy, an applicant shall submit a test plan to the Executive Officer for conducting the emissions reduction testing, durability testing, and a timeline for testing.
- (2) The applicant shall submit an application that includes all source test data only after the applicant receives CARB approval for the test plan.
- (3) If the Executive Officer approves of the application, the applicant's strategy will be considered a "CARB approved emission control strategy" and shall become a compliance option for the type(s) of vessel visits for which the emission control strategy is approved, when used in a manner that is consistent in accordance with all the conditions of the approval.

(f) Test plan requirements.

- (1) A test plan shall include:
  - (A) The contact persons, phone numbers, names, and addresses of person submitting the test plan.
  - (B) Description of the emission control strategy's principles of operation. A schematic depiction of the components and operation must be included. It is the responsibility of the applicant to demonstrate that the qualifying strategy relies on sound principles of science and engineering to achieve emission reductions.
  - (C) Description of testing to be conducted to demonstrate emission reductions and durability.

- (D) Timeline for all emissions reduction testing and durability testing, including an estimate for the testing's duration and the number of vessel visits needed to complete proposed testing.

(2) Durability.

The applicant of an emission control strategy shall demonstrate, to the satisfaction of the Executive Officer, the durability of the applicant's emission control strategy through an actual field demonstration. If the applicant has demonstrated the durability of the equipment (identical in design and components) in a prior verification or has demonstrated durability through field experience, the applicant may request that the Executive Officer accept the previous demonstration in fulfillment of this requirement. In evaluating such a request, the Executive Officer may consider all relevant information including, but not limited to, the similarity of baseline emissions and application duty cycles, the relationship between the emission control group used in previous testing and the current emission control group, the number of engines tested, evidence of successful operation and user acceptance, and published reports.

(3) Test plan disapproval.

If, after reviewing the test plan, the Executive Officer determines that the applicant has not made a satisfactory demonstration that its strategy relies on sound principles of science and engineering to achieve emission reductions at the rates required for certification or if the test plan is incomplete, the Executive Officer shall notify the applicant of the disapproval in writing within 30 calendar days of receiving the test plan. The applicant may choose to withdraw from the application process or submit additional materials and clarifications.

(4) Test plan approval.

Within 45 calendar days after determining the test plan is satisfactory, the Executive Officer shall issue a test plan approval letter to the applicant.

(g) Source testing.

A person shall use source testing to demonstrate that a proposed emission control strategy achieves the performance standards in section 93130.5-(d) of this Control Measure. Testing must be done by certified third party source testers specified in the test plan. Alternative test methods or emission verifications may be used when specified in the test plan upon written approval from the Executive Officer. The following requirements shall apply to source testing conducted under this Control Measure, unless the Executive Officer has provided written approval of alternative applicable test methods or emission verifications specified in the test plan:

- (1) NO<sub>x</sub>, N<sub>2</sub>O, CO<sub>2</sub>, CO, CH<sub>4</sub>, and Diesel PM or PM<sub>10</sub>, shall be measured using ISO 8178 Test Procedures: ISO 8178-1: August 15, 1996(E) ("ISO 8178 Part 1"); ISO 8178-2: August 15, 1996(E) ("ISO 8178 Part 2"); and ISO 8178-4: August 15, 1996(E)

(“ISO 8178 Part 4” August 15, 1996), respectively, all of which are incorporated herein by reference;

- (2) PM<sub>2.5</sub> is calculated using the factor of weight fraction of PM<sub>2.5</sub>/TPM based on CARBs speciation data for PM size fractions (“PMPROF REF (Excel) - Reference number for PM profiles,” July 8, 2019, incorporated herein by reference). For MGO, the factor is 0.92;
  - (3) ROG shall be calculated as a fraction of the TOG, set forth in CARB’s Off-Road Diesel HC to Rog/Tog Ratio (“FRAC (Excel) - Fraction data for source categories,” February 21, 2019, incorporated herein by reference). For MGO, the factor is 0.856 for internal combustion engines and 0.946 for boilers. TOG shall be measured using Method 25A (40 CFR Pt. 60, App. A-7, Method 25A, December 23, 1971), which is incorporated herein by reference;
  - (4) CO<sub>2</sub>E for a control system shall be calculated as follows  $\text{lbs CO}_2\text{E} = (\text{lbs CO}_2 + 25 * \text{lbs CH}_4 + 298 * \text{lbs N}_2\text{O})$ . CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O shall be measured before and after the control strategy, and include any uncontrolled auxiliary sources for the control strategy using the test methods specified in section 93130.5(g)(1) and 93130.5(g)(3) in this Control Measure. Strategies that use a fuel with a CARB Low Carbon Fuel Standard certified pathway may apply a reduction to CO<sub>2</sub>E by the factor of the carbon intensity of the fuel to the carbon intensity of the standard fuel;
  - (5) Grid-neutral shall be determined by calculating the ratio of the CO<sub>2</sub>E to the measured MWh of the control system which value must be lower than the state output emission rate;
  - (6) Ammonia slip shall be measured using the Bay Area Air Quality Management District Source Test Procedure ST-1B, Ammonia Integrated Sampling, dated January 20, 1982, which is incorporated herein by reference, or other equivalent CARB or district approved test method(s);
  - (7) The sulfur content of fuels shall be determined pursuant to International Standard ISO 8754 (as adopted on July 15, 2003), which is incorporated herein by reference;
  - (8) Exhaust Flow Rate shall be measured using CARB Method 100, Procedures for Continuous Gaseous Emission Stack Sampling (as amended July 28, 1997), which is incorporated herein by reference; and
  - (9) Engine Work shall be determined by measuring the total power output in MWh of the control strategy’s generators electrical output during the test periods.
- (h) Application Submittals to CARB.

- (1) All applications, correspondence, and reports relating to source testing shall be submitted to CARB addressed to:  
CHIEF, TRANSPORTATION AND TOXICS DIVISION  
CALIFORNIA AIR RESOURCES BOARD  
1001 I STREET  
SACRAMENTO, CA 95814
  - (2) Verbal submissions do not constitute acceptable application formats.
  - (3) Supporting data in electronic format may be accepted as part of the application at the discretion of the Executive Officer.
  - (4) Applications shall follow the format and include the contents described in CARB's Recommended Emissions Testing Guidelines for Ocean-Going Vessels (dated June 20, 2012), which is incorporated herein by reference.
  - (5) CARB may allow electronic or e-mail submittal with instructions on the CARB website.
  - (6) The Executive Officer shall determine whether the application is complete. If incomplete, the Executive Officer will notify the applicant within 30 calendar days requesting additional information required to complete the application.
- (i) CARB approval of the control strategy.

Within 90 calendar days after an application has been deemed complete, the Executive Officer shall act to approve or disapprove the application. The Executive Officer shall notify the applicant of the decision in writing and identify any terms and conditions that are necessary for any party to use the CARB approved emission control strategy. The approval of an emission control strategy is valid for 5 years, unless it is revoked by CARB as set forth in section 93130.5 (i)(3).

- (1) Extensions of CARB approved emission control strategy.  
If the applicant wishes to extend an approval of a CARB approved emission control strategy, it must apply to do so within 6 months of the end date of the approval to ensure the Executive Order does not lapse. The applicant may apply for an extension by submitting an extension application to the Executive Officer asserting that the strategy has not changed and is still effective, following to the requirements specified in subsection (h) above.
- (2) Modifications to a CARB approved emission control strategy.
  - (A) Proposed modifications to the design or operation of a CARB approved emission control strategy that have any potential to affect the emissions control effectiveness or operational

performance must be reviewed and approved by the Executive Officer before they are implemented.

- (B) Failure to obtain Executive Officer approval before modifying the design or operation of a CARB approved emission control strategy is a violation, and may also be grounds for revocation of CARB's approval, as set forth in subsection 93130.5 (i)(3).
- (C) The applicant shall describe in detail the design modification along with an explanation of how the modification will change the operation and performance of the strategy. The applicant shall submit additional test data, durability data, engineering justification and analysis, or any other information deemed necessary by the Executive Officer to address the differences between the modified and original designs, and to ensure that the strategy's reductions are maintained.
- (D) A modification includes, but is not limited to:
  - i. Any change of materials used in, or specifications of, the control strategy;
  - ii. Any change to the components, component design, composition, materials, or reagent usage;
  - iii. Any change to the sensors, part sizes, or sizing methodology;
  - iv. Any change to the monitoring and notification system control; logic, algorithms, operating parameters; or
  - v. Any proposed change to a portion of the approval.
- (E) The Executive Officer will reissue the approval with updates to reflect the modifications if he or she determines that the modifications have no material effect on the control strategy, or if the modifications are found to affect the control strategy but the strategy's emission reductions still meet the requirements in section 93130.5(d) of this Control Measure.

(3) Revoking a CARB approved emission control strategy.

If an applicant modifies the design or operation of a CARB approved emission control strategy without review and approval pursuant to subsection (2) above, the Executive Officer may revoke its approval of the emission control strategy. To resume compliance using the strategy, the applicant must re-submit an application and receive a new approval.

(j) Review of CARB approved emission control strategy.

- (1) At a minimum, emission control technologies shall be tested annually to demonstrate that the expected percentage of emissions reductions being achieved.

- (2) The applicant shall provide the results of such testing to the Executive Officer by December 31, annually.
- (3) The Executive Officer may modify the testing frequency as he or she deems appropriate.
- (4) The Executive Officer may request that the owner or operator of a CARB approved emission control strategy conduct periodic emission source testing or other types of monitoring to verify the proper operation of alternative control technologies or distributed generation equipment, or to verify the emission rate of an auxiliary engine.

(k) Records Retention

- (1) Records made pursuant to Section 93130.5 shall be kept for a minimum of five years. This information shall be supplied to the Executive Officer within 30 days of a request from CARB staff.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

**Section 93130.6 Opacity Requirement.**

- (a) No person shall discharge or cause the discharge from any ocean-going vessel at berth and at anchor, into the atmosphere, any visible emissions of any air pollutant, for a period of periods aggregating three minutes in any 1 hour from any operation on the vessel that is:
  - (1) As dark as the Ringelmann 2, as published by the United States Bureau of Mines (May 1967), which is incorporated by reference; or
  - (2) Of such opacity as to obscure an observer's view to a degree equal to or greater than the Ringelmann 2.
- (b) The California time aggregate method and the United States Environmental Protection Agency Opacity Test Method 9 (40 CFR Pt. 60, App. A-4, December 23, 2017), which is incorporated herein by reference will be used to analyze the readings to determine compliance.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510, 41511, and 41701, Health and Safety Code.

**Section 93130.7. Vessel Operator Requirements.**

Vessel operators that visit a berth or terminal in California shall meet the following requirements, [except as provided in section 95130.5\(d\)\(7\)](#). Any failure to perform any specific items in this section shall constitute a separate violation for each day that the failure occurs.

- (a) Shore power requirements for at berth emission reductions.

**Vessel** operators with commissioned shore power vessels shall plug in to shore power on each and every visit to a compatible shore power berth.

(b) Requirements for vessel auxiliary engines.

Vessel operators shall reduce auxiliary engine emissions to the performance standards set forth in section 93130.5(d)(1) of this Control Measure through use of a CARB approved emission control strategy while at berth by the date specified for each vessel type in this section unless the visit qualifies for an exception identified in sections 93130.4, 93130.8, or 93130.10 of this Control Measure. A summary of responsibilities is provided in section 93130.17 of this Control Measure.

<b>Table 1: Compliance Start Dates by Vessel Type</b>	
<b>January 1, 2021</b>	Container and refrigerated cargo vessels
<b>January 1, 2021</b>	Passenger vessels
<b>January 1, 2025</b>	Roll-on roll-off vessels
<b>January 1, 2027</b>	Tanker vessels that visit the ports of Los Angeles or Long Beach
<b>January 1, 2029</b>	All remaining tanker vessels

(c) Requirements for tanker auxiliary boilers on tanker vessels with steam driven product pumps.

Vessel operators shall reduce boiler emissions to the performance standards set forth in section 93130.5(d)(2) of this Control Measure through use of a CARB approved emission control strategy while at berth by the date specified for each vessel type in this section unless the visit qualifies for an exceptions identified in sections 93130.4, 93130.8, or 93130.10 of this Control Measure. A summary of responsibilities is provided in section 93130.17 of this Control Measure.

<b>Table 2: Compliance Start Dates for Tanker Vessels with Steam Driven Product Pumps</b>	
<b>January 1, 2027</b>	Tanker vessels with steam driven product pumps that visit the ports of Los Angeles or Long Beach
<b>January 1, 2029</b>	All remaining tanker vessels with steam driven product pumps

(d) Visits by vessels with on-board control strategies.

If the CARB approved emission control strategy is operated solely on the vessel, vessel operators shall confirm in writing with terminal operator that the equipment is operational and will be used, prior to the vessel’s arrival at a California berth.

(e) Vessel compliance checklists.

Vessel operators shall complete all items in the checklist to ensure compliance under the Control Measure:

- (1) At least 7 calendar days before arrival, the vessel operator shall communicate in writing with the terminal operator and operator of the CARB approved emission control strategy to coordinate the use of a CARB approved emission control strategy and do all of the following if the vessel operator is using a CARB approved emission control strategy:
  - (A) Request use of a CARB approved emission control strategy; and
  - (B) Supply the terminal operator and the operator of the CARB approved emission control strategy with information about the compatibility of the vessel with the intended CARB approved emission control strategy.
- (2) Ensure the vessel is commissioned as required by the terminal operator.
- (3) Use shore power or another CARB approved emission control strategy during the vessel visit.
  - (A) Begin using shore power or another CARB approved emission control strategy within 1 hour after “Ready to Work”.
  - (B) Cease using shore power or another CARB approved emission control strategy no sooner than 1 hour before “Pilot on Board.”
- (4) Report the following visit information to CARB electronically within 7 calendar days of departure, using local time for all dates and times:
  - (A) Vessel name;
  - (B) Vessel IMO number;
  - (C) Vessel type;
  - (D) Vessel operator contact information, including fleet, name, address, email address, and telephone number;
  - (E) Port, terminal, and berth visited;
  - (F) Vessel arrival time and vessel departure time;
  - (G) Vessel shift to another berth (must be reported as a separate visit), where applicable;
  - (H) Type of CARB approved emission control strategy used, where applicable;
  - (I) Date and time when vessel declared as “Ready to Work”;

- (J) date and time when a CARB approved emission control strategy is begins reducing emissions and date and time when a CARB approved emission control strategy stops reducing emissions, where applicable;
  - (K) Type of fuel used in auxiliary engine(s) and auxiliary boiler(s);
  - (L) Sulfur content of fuel used in auxiliary engine(s) and auxiliary boiler(s), where applicable;
  - (M) Amount of fuel used in auxiliary engine(s) and boiler(s), during vessel visit, where applicable;
  - (N) Date and time pilot on-board in preparation for departure;
  - (O) Information specified in the approved compliance strategy's Executive Order compliance instructions;
  - (P) Information if a vessel uses an exception, including the type of exception, a detailed description, including dates and times, and any relevant correspondence (e.g. emails) documenting the visit exception;
  - (Q) Information if a vessel uses the remediation fund, including detailed description of the allowed circumstance outlined in section 93130.15 of this Control Measure, the number of days/hours the event took place, and the tier rating of the auxiliary engine; and
  - (R) Information if a TIE or VIE is used for the visit including the person who authorized the use of the TIE or VIE.
- (f) Send accurate and complete reporting to CARB.
- (1) Vessel compliance information submitted to CARB shall:
    - (A) Be written in the English language;
    - (B) Attest that the information submitted is true, accurate and complete, signed by the Responsible Official under penalty of perjury; and
    - (C) Be submitted to CARB in writing to:
 

CHIEF, TRANSPORTATION AND TOXICS DIVISION  
CALIFORNIA AIR RESOURCES BOARD  
1001 I STREET  
SACRAMENTO, CA 95814
  - (2) CARB may also allow online submittal to a CARB reporting system or e-mail with instructions on the CARB website.
- (g) Records Retention

- (1) Records made pursuant to Section 93130.7 shall be kept for a minimum of five years. This information shall be supplied to the Executive Officer within 30 days of a request from CARB staff.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.8 Vessel Visit Exceptions.**

Vessel operators are exempt from the operational requirements in section 93130.7 of this Control Measure if any of the following occurs.

- (a) Vessel safety and emergency events.

The emission reduction requirements of section 93130.7 and section 93130.9 of this Control Measure do not apply during a portion of the visit that a responsible official reasonably determines that compliance with section 93130.7 would endanger the safety of the vessel, its crew, its cargo or its passengers because of severe weather conditions, a utility event or other extraordinary reasons beyond the master's reasonable control. All safety and emergency events are subject to review and audit by the Executive Officer. This exception applies if approved and only as long as the event occurs and only to the extent necessary to secure the safety of the vessel, its crew, its cargo, or its passengers and provided that the master:

- (1) Take all reasonable precautions after the conditions necessitating the exception have ended to avoid or minimize repeated claims of exception under this subsection; and
- (2) Include with the reporting requirement of section 93130.7(e)(4) of this Control Measure all documentation necessary to establish the conditions necessitating the safety exception and the date(s), local time, and location. All required documentation must be in the English language.

- (b) Bulk and general cargo vessels.

Bulk and general cargo vessels are not subject to the vessel auxiliary engine requirements in sections 93130.7(b) of this Control Measure, and are only required to report their vessel visit activity under section 93130.7(e)(4) of this Control Measure starting January 1, 2021.

- (c) Vessel commissioning.

The first vessel commissioning visit made by a vessel to a terminal may be an exception as long as the vessel was able to successfully connect to shore power during that visit. Documentation of a successful vessel commissioning

must be submitted with the vessel visit reporting requirements of section 93130.7(e)(4) of this Control Measure. Additional vessel commissioning visits may qualify for exception if approved by CARB in writing where the vessel operator demonstrates:

- (1) The commissioning process could not be accomplished in a single visit; or
  - (2) The terminal requires that the vessel be recommissioned.
- (d) Research.

Vessel visits that participate in testing of an alternative technology may be an exception provided that the vessel operator:

- (1) Receives a CARB approved test plan for the alternative technology prior to arrival;
  - (2) Participates in testing in accordance with the approved test plan;
  - (3) Keeps a copy of the approved test plan on the vessel at all times;
  - (4) Provides a copy of the approved test plan to CARB staff upon request; and
  - (5) Reports all information including the use of the research exception pursuant to section 93130.7(e)(4) of this Control Measure.
- (e) Previously unregulated vessels.
- (1) Until January 1, 2023, previously unregulated vessels are not subject to the vessel auxiliary engine requirements in sections 93130.7(b) of this Control Measure.
  - (2) Vessel operators are required to report their vessel visit activity under section 93130.7(e)(4) of this Control Measure.
- (f) Vessels visiting a low activity terminal.
- (1) The specific requirements for vessel categories in section 93130.7 and section 93130.9 of this Control Measure do not apply to vessel visits to low activity terminals as specified in section 93130.10(a) of this Control Measure.
  - (2) Vessel operators are required to report their vessel visit activity under section 93130.7(e)(4) of this Control Measure starting on January 1, 2021.
- (g) Vessel incident event (VIE) and terminal incident event (TIE).
- (1) The requirements of section 93130.7 and 93130.9 of this Control Measure do not apply during a visit if the fleet operator uses a VIE or terminal operator uses a TIE as specified in section 93130.11 of this Control Measure.

- (2) Vessel operators are required to report their vessel visit activity under section 93130.7(e)(4) of this Control Measure.
- (h) Remediation.
  - (1) The requirements of this Control Measure do not apply during a visit that qualifies and uses the remediation fund option in section 93130.15 of this Control Measure.
  - (2) Vessel operators are required to report their vessel visit activity under section 93130.7(e)(4) of this Control Measure.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.9 Terminal Operator Requirements.**

Terminal operators that receive ocean-going vessels in California shall meet the following requirements, [except as provided in section 95130.5\(d\)\(7\)](#). Any failure to perform any specific items in this section shall constitute a separate violation for each day that the failure occurs.

- (a) Shore power requirements for at berth emission reductions.
  - (1) Operators of terminals with berths equipped to receive compatible shore power vessels must connect these vessels to shore power when visited by a commissioned shore power vessel.
  - (2) The terminal operator is responsible for commissioning vessels equipped with compatible shore power.
  - (3) If the commissioned shore power vessel is berthed in a way that prevents it from connecting to shore power, the terminal may use a TIE or must provide an alternative CARB approved emission control strategy compatible with the vessel.
- (b) Visits to terminals without shore power.

Terminals without shore power are responsible for arranging a CARB approved emission control strategy for each visit by vessels with requirements for auxiliary engines or tanker auxiliary boilers in section 93130.7 (b) or 93130.7 (c) of this Control Measure. If neither the vessel nor the terminal has shore power, then it is the shared responsibility of both parties to arrange a CARB approved emission control strategy for this visit.

- (c) Visits by vessels with on-board control strategies.

If the CARB approved emission control strategy is operated solely on the vessel, terminal operators are required to confirm with vessel operators that the equipment is operational and will be used, prior to the vessel's arrival at a California berth.

(d) Terminal operator compliance checklist.

Terminal operators shall complete the following items in this checklist to ensure compliance under the Control Measure:

- (1) At least 7 calendar days before arrival, the terminal operator shall communicate with the vessel operator and operator of the CARB approved emission control strategy in writing to coordinate the use of a CARB approved emission control strategy. If the vessel operator is using a CARB approved emission control strategy, the terminal operator shall supply the vessel operator with information about the terminal's compatibility with the intended CARB approved emission control strategy.
- (2) For shore power:
  - (A) Ensure shore power vessels are commissioned for shore power at the terminal they are visiting or notify vessel operator if commissioning is required.
  - (B) Position vessel appropriately to enable use of shore power or the CARB approved emission control strategy.
  - (C) Record power meter reading before starting shore power;
  - (D) Plug in vessel within 1 hour of vessel "Ready to Work";
  - (E) Disconnect shore power no more than 1 hour before "Pilot on Board"; and
  - (F) Record power meter reading after disconnecting from shore power.
- (3) Report the following vessel visit information within 7 calendar days of the vessel's departure, using local time for all dates and times:
  - (A) Vessel name;
  - (B) Vessel IMO number;
  - (C) Port, terminal and berth visited;
  - (D) Terminal operator contact information, including name, address, email address, and telephone number;
  - (E) Arrival date and time;
  - (F) Departure date and time;
  - (G) CARB approved emission control strategy used;
  - (H) If CARB approved emission control strategy was provided by the terminal, or terminal and vessel shared arrangement responsibility, start and end date and time of emission control;

- (I) For shore power visits, the terminal must report the power meter readings at the time of shore power connection and after disconnection;
  - (J) Information specified in the approved compliance strategy's compliance instructions;
  - (K) Information relating to any exception claimed by the terminal during the visit, including a detailed description of the exception and documentation detailing the exception, and any relevant correspondence (e.g. emails) documenting the visit exception;
  - (L) Information if a terminal uses the remediation fund, including detailed description of the allowed circumstance outlined in section 93130.15 of this Control Measure, the number of days/hours the event took place, and the tier rating of the vessel's engine; and
  - (M) Information if a TIE or VIE is used for the visit including the person who authorized and if a TIE or VIE was used.
- (e) Send accurate and complete reporting to CARB.
- (1) Terminal compliance information submitted to CARB shall:
    - (A) Be written in the English language;
    - (B) Attest that the information is true, accurate and complete, signed by the Responsible Official under penalty of perjury, and
    - (C) Be submitted to CARB in writing to:
 

CHIEF, TRANSPORTATION AND TOXICS DIVISION  
CALIFORNIA AIR RESOURCES BOARD  
1001 I STREET  
SACRAMENTO, CA 95814
  - (2) CARB may also allow online submittal to a CARB reporting system or e-mail with instructions on the CARB website.
- (f) Construction or repair.
- The terminal operator is responsible for providing an alternative CARB approved emission control strategy for vessels to reduce emissions if the CARB approved emission control strategy for the berth is unavailable due to construction or repair. Terminals also have the option of using a TIE or remediation fund for construction or repair.
- (g) Records Retention
- (1) Records made pursuant to Section 93130.9 shall be kept for a minimum of five years. This information shall be supplied to the Executive Officer within 30 days of a request from CARB staff.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.10. Terminal Exceptions.**

The terminal-related requirements of this Control Measure in section 93130.9 are subject to certain exceptions, set forth in this section.

(a) Vessel visits to a low activity terminal.

- (1) The at berth emission reduction requirements of section 93130.7 and section 93130.9 of this Control Measure do not apply during a visit if the vessel visits a low activity terminal.
- (2) For each vessel type listed in section 93130.7(b), a terminal that receives fewer than 20 visits in both 2019 and 2020 is initially considered a low activity terminal for that vessel type.
- (3) A low activity terminal that receives 20 or more visits per year for two consecutive calendar years from a vessel type no longer qualifies for the low activity terminal exception for that vessel type and is required to reduce emissions starting January 1 of the following year.
- (4) Terminal operators shall report vessel visit information under section 93130.9 (d)(3) of this Control Measure.

(b) Bulk and general cargo vessels.

Terminals that receive bulk and general cargo vessels are not required to arrange for CARB approved emission control strategies for their visits. Terminals are only required to report the vessel visit information for bulk and general cargo vessels under section 93130.9 (d)(3) of this Control Measure starting January 1, 2021.

(c) Terminal safety and emergency events.

The at berth emission reduction requirements of section 93130.7 and section 93130.9 of this Control Measure do not apply during a visit if a responsible official reasonably determines that compliance with this section would endanger the safety of the terminal, or its staff because of severe weather conditions, a utility event, or other extraordinary reasons beyond the terminal's reasonable control. All safety and emergency events are subject to review and audit by the Executive Officer. This exception applies if approved and only as long as the event occurs provided that the terminal operator:

- (1) Take all reasonable precautions after the conditions necessitating the exception have ended to avoid or minimize repeated claims of exception under this subsection; and

- (2) Include with the reporting requirements of section 93130.9(d)(3) of this Control Measure all documentation necessary to establish the conditions necessitating the terminal safety exception and the date(s), local time, and location. All required documentation must be in English.

(d) Research.

Vessel visits that participate in testing of an alternative technology may be excluded from the at berth emission reduction requirements in section 93130.7 and section 93130.9 of this Control Measure. Research visits are subject to reporting requirements 93130.9(d)(3) of this Control Measure. To qualify for a research exception, the following conditions must apply:

- (1) A research visit to a terminal must have a CARB approved research exception prior to arrival;
- (2) A terminal must confirm and record a visit's research exception status with CARB prior to arrival; and
- (3) Any testing must be conducted in accordance with the approved test plan.

(e) Terminal incident event (TIE) and vessel incident event (VIE).

The at berth emission reduction requirements of section 93130.7 and section 93130.9 of this Control Measure do not apply during a visit if the vessel fleet uses a VIE or the terminal operator uses a TIE specified in section 93130.11 of this Control Measure. Terminal operators shall report vessel visit information under section 93130.9 (d)(3) of this Control Measure.

(f) Remediation.

The at berth emission reduction requirements of section 93130.7 and section 93130.9 of this Control Measure do not apply during the portion of a visit that qualifies and uses the remediation fund option in section 93130.15 of this Control Measure. Terminal operators shall report vessel visit information under section 93130.9(d)(3) of this Control Measure.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.11. Vessel Incident Events (VIE) and Terminal Incident Events (TIE).**

A VIE or a TIE accommodates a limited number of situations where a vessel does not reduce emissions during a visit.

(a) Granting VIEs and TIEs.

- (1) The fleet that is designated in a vessel’s visit report will be granted VIEs based on a percentage of fleet vessel visits to a California port between January 1 and December 31 in the previous year. The terminal operator that is designated in a vessel’s visit report will be granted TIEs based on a percentage of vessel visits to the terminal between January 1 and December 31 in the previous year. In 2021, VIEs and TIEs will be granted by CARB staff by January 1, 2021. Each year after, VIEs and TIEs will be granted by CARB staff on February 1 of that year.
- (2) These percentages are listed in the table in section 93130.11(b) of this Control Measure. The number of VIEs and TIEs granted is rounded to the nearest whole number. Since visit information is not available initially, in 2021, VIEs and TIEs will be determined by the fleet 2019 recordkeeping requirements in California Code of Regulations, title 17, section 93118.3(g)(1)(B) and wharfinger data in section 93118.3(g)(3)(A) of the previous at berth regulation.
- (3) The fleet operator will be able to assign each received VIE to a visit made by a vessel in the fleet. The terminal operator will be able to assign each received TIE to a visit made by a vessel to the terminal.

(b) Table of VIEs and TIEs rates.

<b>Table 3: VIEs and TIEs Rates by Vessel Type per Year</b>											
		<b>2021</b>	<b>2022</b>	<b>2023</b>	<b>2024</b>	<b>2025</b>	<b>2026</b>	<b>2027</b>	<b>2028</b>	<b>2029</b>	<b>2030+</b>
<b>TIEs</b>	<b>All Terminals</b>	15%	15%	15%	15%	5%	5%	5%	5%	5%	5%
<b>VIEs</b>	<b>Container/ Reefer</b>	5%	5%	5%	5%	5%	5%	5%	5%	5%	5%
	<b>Passenger</b>	5%	5%	5%	5%	5%	5%	5%	5%	5%	5%
	<b>Ro-ro</b>					5%	5%	5%	5%	5%	5%
	<b>LA/LB Tankers</b>							5%	5%	5%	5%
	<b>Other Tankers</b>									5%	5%

(c) Expiring VIEs and TIEs.

VIEs and TIEs expire on January 31 of the year after they are granted. VIEs can only be used at the port for which they are granted and by the fleet they are granted to and TIEs can only be used at the terminal for which they are granted.

(d) Retiring VIEs and TIEs.

VIEs and TIEs are limited in number and can be used for infrequent situations listed in section 93130.17 of this Control Measure. Fleet operators and terminal operators must report the use of a VIE or TIE with the vessel visit report in sections 93130.7(e) and 93130.9(d) of this Control Measure. VIEs and TIEs cannot be traded with other fleets, terminals, or any other entity.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

**Section 93130.12. CARB Approved Emission Control Strategy Operator Requirements.**

CARB approved emission control strategy operators shall fulfill the following responsibilities:

- (a) Maintain subcontractor services and agreements.
  - (1) Maintain a list of all subcontracted service providers and the services performed by each, maintaining copies of all agreements with service providers.
  - (2) Provide copies to CARB upon request of any agreement with service providers.
- (b) CARB approved emission control strategy checklist.

CARB approved emission control strategy operators shall complete all of the following items in this checklist for each vessel visit to ensure compliance under the Control Measure. Any failure to perform any specific items in this section shall constitute a separate violation for each day that the failure occurs.

- (1) Notification. At least 7 calendar days before a vessel's arrival, the operator of the CARB approved emission control strategy must coordinate in writing with the vessel operator and terminal operator for the use of the strategy and supply the vessel operator with information about the compatibility with the vessel and terminal of the CARB approved emission control strategy.

- (2) Operational. During the visit, the operator of the CARB approved emission control strategy shall:
- (A) Begin use of control strategy within 1 hour of vessel “Ready to Work”;
  - (B) Record inlet and outlet levels of emissions during the visit; and
  - (C) Continue using control strategy until at least 1 hour before “Pilot on Board”.
  - (D) Ensure vessels are operating on CARB compliant distillate marine fuel.
- (3) Reporting. The operator of the CARB approved emission control strategy shall report the following information regarding the vessel visit within 7 calendar days of vessel departure, using local time for all dates and times:
- (A) Vessel name;
  - (B) Vessel IMO number;
  - (C) Vessel type;
  - (D) Port, terminal and berth visited;
  - (E) Vessel operator contact information, including name, address, email address, and telephone number;
  - (F) Terminal operator contact information, including name, address, email address, and telephone number;
  - (G) Arrival date and time of the vessel;
  - (H) Departure date and time of the vessel;
  - (I) Dates and times when a CARB approved emission control strategy starts controlling emissions and finishes controlling emissions; and
  - (J) Vessel emissions while control strategy operated for the following categories:
    - i. NO<sub>x</sub> emissions in g/kW hr;
    - ii. PM<sub>2.5</sub> emissions in g/kW hr; and
    - iii. ROG emissions in g/kW hr.

(4) Malfunction Reporting.

The operator of the CARB approved emission control strategy shall report within 24 hours to CARB by electronic means, the following information regarding any malfunction that is expected to create emissions in excess of any applicable emissions limitation for a period greater than 1 hour. If electronic notification is not immediately possible, telephone notification or

notification at the beginning of the next working day is acceptable. The notification must include the following information:

- (A) Identification of the equipment causing the emissions in excess of any applicable emissions limitation;
- (B) Magnitude, nature, and cause of the excess emissions;
- (C) To the extent known, time and duration of the excess emissions;
- (D) Description of the corrective actions taken or expected to be taken to remedy the malfunction and to limit the excess emissions;
- (E) Information sufficient to demonstrate, to CARB's Executive Officer's reasonable satisfaction, that the malfunction was not caused in any way by poor maintenance, negligent operation, or any other reasonably preventable upset condition or equipment breakdown; and
- (F) Readings from any continuous emission monitor used in the emission control strategy and readings from any ambient monitors nearby.

(5) Corrective Action Report.

Within 7 calendar days after a malfunction has been corrected, the operator of the CARB approved emission control strategy shall submit a written report to CARB that includes:

- (A) A statement that the malfunction has been corrected, the date of correction, and proof of compliance with all applicable CARB approval requirements;
- (B) The specific cause of the malfunction;
- (C) A description of any preventive measures taken and/or to be taken; and
- (D) A statement affirming under penalty of perjury that the malfunction was not caused entirely or in part by poor maintenance, careless operation, poor design, or any other preventable condition or preventable equipment breakdown.

(6) Records Retention

- (A) Records made pursuant to Section 93130.12 shall be kept for a minimum of five years. This information shall be supplied to the Executive Officer within 30 days of a request from CARB staff.

(7) All information submitted to CARB shall:

- (A) Be written in the English language;
- (B) Attest that it is true, accurate, and complete, signed by the Responsible Official under penalty of perjury; and

(C) Be submitted to CARB in writing to:  
CHIEF, TRANSPORTATION AND TOXICS DIVISION  
CALIFORNIA AIR RESOURCES BOARD  
1001 I STREET  
SACRAMENTO, CA 95814

(D) CARB may also allow online submittal to a CARB reporting system or e-mail with instructions on the CARB website.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.13. Port Requirements.**

(a) Port infrastructure.

Ports with terminals not excluded under the thresholds set forth in section 93130.10(a) Terminal Exceptions of this Control Measure, shall provide equipment or necessary infrastructure that is outside of terminal operators' contractual ability to provide and which will enable a terminal to comply with this Control Measure including but not limited to necessary underground infrastructure, conduit, cabling, ducting, and shore power vaults.

(b) Cessation of obligation.

If a terminal operator and/or vessel operator elects to purchase and use CARB approved emissions control equipment that does not need port assistance or infrastructure to operate in compliance with this Control Measure, then the port has no additional responsibility for that equipment.

(c) Wharfinger data.

All operators of a public or private California port or independent marine terminal shall provide wharfinger data to the Executive Office of CARB annually by January 31st of the following calendar year, regardless of visit activity. At a minimum, the wharfinger information shall include for each visit to the port:

- (1) Name of the vessel;
- (2) Vessel type;
- (3) Name, address, email and telephone number for Company operating the vessel;
- (4) IMO number for each vessel;
- (5) Berth used by the vessel; and

- (6) Date(s) and time the vessel was initially tied to the berth and subsequently released from the berth.
- (d) Send accurate and complete reporting to CARB.

Port reports and wharfinger information submitted to CARB shall:

- (1) Be written in the English language;
- (2) Attest that it is true, accurate, and complete, signed by the Responsible Official under penalty of perjury; and
- (3) Be submitted to CARB in writing to:  
CHIEF, TRANSPORTATION AND TOXICS DIVISION  
CALIFORNIA AIR RESOURCES BOARD  
1001 I STREET  
SACRAMENTO, CA 95814
- (4) If available, CARB may also allow electronic or e-mail submittal with instructions on the CARB website.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

#### **Section 93130.14. Terminal and Port Plans and Interim Evaluation.**

- (a) Terminal plans.

- (1) Terminal plan requirements.

Beginning in 2021, terminal operators shall submit a terminal plan that discusses how the terminal will comply with the requirements for ocean-going vessels visiting each berth, [or the requirements for achieving reductions from alternative sources as provided in 93130.5\(d\)\(7\)](#). For vessel categories with compliance dates after 2021, the terminal operator shall submit plans with the most likely control strategy. As an alternative, Ports may submit plans for their terminal operators.

- (2) Terminal plan submission dates.

Terminal operators shall submit terminal plans to CARB by the following dates:

- (A) Container, refrigerated cargo, passenger terminals: July 1, 2021;
- (B) Ro-ro terminals: December 1, 2021;
- (C) [LA/LBAII](#) tanker terminals, [complying with 93130.5\(d\)\(7\)](#): December 1, 2021;
- (D) All ~~other~~ tanker terminals, [complying with 93130.5\(d\)\(1\)-\(2\)](#): ~~December 1, 2021~~ [July 1, 2024](#); and
- (E) Low-use terminals that exceeds the terminal threshold shall

submit a terminal plan by July 1 the following year.

- (F) Ro-ro and tanker terminals shall revise and resubmit terminal plans on the following schedule, which must reflect any changes to the terminal since the initial plan.
  - i. Ro-ro terminals: February 1, 2024;
  - ii. LA/LB tanker terminals: February 1, 2026; and
  - iii. All other tanker terminals: February 1, 2028

### (3) Terminal plan information.

Except for terminals complying with section 93130.5(d)(7), the terminal plan shall include discussion of necessary infrastructure modifications needed to reduce emissions from ocean-going vessels at a terminal. For each strategy implemented at a terminal, the terminal plan and shall include:

- (A) Identification and description of all necessary equipment, including whether it will be located on the vessel, wharf, shore, or elsewhere;
- (B) Number of vessels expected to visit the terminal using the strategy;
- (C) List of each berth with geographic boundary coordinates;
- (D) Identity of berth(s) where equipment will be used;
- (E) Terminal/port specific berthing restrictions;
- (F) Schedule for implementing equipment; and
- (G) Division of responsibilities between the terminal operator and the port, including contractual limitations applicable to the terminal, relevant to enacting the infrastructure required by each terminal's plan; and
- (H) A terminal claiming that a physical and/or operational constraint will delay its ability to implement its preferred CARB-approved control strategy to achieve emission reductions from vessels at berth according to the requirements of section 93130 et seq, must also include with its terminal plan a technical feasibility study evaluating if there are any other emission control options that could be implemented more quickly at the terminal.

### (4) Alternative Terminal Plan Information

- (A) For at-berth emission reductions, the information in section 93130.14(a)(3);
- (B) Identification and description of all vessel and/or onshore sources from which alternative reductions will be achieved;

(C) Schedule for completing work necessary to achieve alternative reductions; and

(D) Reported NOx, ROG and PM2.5 emissions data from 2016 (or other approved baseline year) for all vessel and/or onshore sources from which alternative reductions will be achieved.

(4)(5) All terminal plans shall be signed by the applicable terminal's Responsible Official under penalty of perjury and are subject to verification by enforcement staff.

(b) Port plans.

(1) Port plan requirements.

Port operators shall submit a plan showing proof that the necessary terminal infrastructure modifications, or the requirements for achieving reductions from alternative sources as provided in 93130.5(d)(7), are being developed or have been completed and/or report any modifications still required in order for all of the Port's terminals with control requirements to reduce emissions of vessels at berth or achieve alternative emissions reductions as provided in 93130.5(d)(7). Ports should use terminal plans as basis for developing port plans, and may submit terminal plans on behalf of one or more of the port's terminal operators.

(2) Port plan submission dates

Port operators shall submit port plans to CARB by the following dates:

(A) Container, refrigerated cargo, passenger terminals: July 1, 2021;

(B) Ro-ro terminals: December 1, 2021;

(C) ~~LA/LB~~ All tanker terminals, complying with 93130.5(d)(7):  
December 1, 2021;

(D) ~~All Non-LA/LB~~ All tanker terminals, complying with 93130.5(d)(1)-(2):  
~~December 1, 2021~~ July 1, 2024;

(E) Updated plan by July 1 the following year after any new terminal at the port exceeds the annual visit threshold.

(3) Port plan information.

Except for ports with terminals complying with 93130.5(d)(7), ~~the~~ port operator shall include in its port plan a discussion of necessary infrastructure modifications needed to reduce emissions from ocean-going vessels at a terminal, and shall. ~~For each strategy implemented at a berth, the plan must~~ include all of the following:

(A) Identification and description of which strategy each applicable terminal will use for compliance;

(B) Identify any equipment purchases and/or construction that are in progress or must still be completed to reduce emissions;

- (C) Provide schedule for installing equipment and/or any necessary construction projects;
- (D) Identify terminals where equipment will be used;
- (E) Listing of each terminal with geographic boundary coordinates;
- (F) Specify any port specific berthing restrictions; and
- (G) List the division of responsibilities between the terminal and the ports for enacting the infrastructure required by each terminal's plan.

#### (4) Alternative Port Plan Information

For ports with terminals complying with section 93130.5(d)(7), the port plan shall include:

- (A) For at-berth emission reductions, the information in section 93130.14(b)(3);
- (B) Identification and description of all vessel and/or onshore sources from which alternative reductions will be achieved;
- (C) Schedule for completing work necessary to achieve alternative reductions; and
- (D) Reported NOx, ROG and PM2.5 emissions data from 2016 (or other approved baseline year) for all vessel and/or onshore sources from which alternative reductions will be achieved.

(4)(5) All port plans shall be signed by the applicable port's Responsible Official under penalty of perjury and are subject to verification by enforcement staff. If port plan schedules are not met, they are subject to enforcement actions.

(c) Approval of terminal or port plan plans.

Within 90 calendar days following submittal of a terminal plan under section 93130.14(a) or a port plan under section 93130.14(b), CARB shall notify the applicable terminal operator or port of any deficiencies in the contents of the plan (as set forth in sections 93130.14(a) and (b) respectively), and/or in the plan's demonstration that the terminal or port is making good faith efforts to facilitate use of a CARB-approved control strategy at each berth. If CARB does not notify the applicable terminal operator or port of any such deficiencies, the plan shall be deemed acceptable on the 90th day following submittal.

(d) Interim evaluation for tanker and ro-ro technology.

CARB staff will facilitate the completion of a feasibility study to assess the progress-~~made in adopting~~ control technologies for use with tanker and ro-ro vessels, as well

as the status of landside infrastructure improvements that may be needed to support emission reductions at ro-ro and tanker terminals. By July 1, 2023, staff will publish analysis and findings results of the feasibility study in a report and make it available for public review at least 30 calendar days prior to presenting the report to the Board at a public meeting. The feasibility study will be conducted by a reputable third party with marine engineering expertise and will include the following elements:

- (1) Engagement with key stakeholders (e.g. vessel and terminal operators, emission control vendors, marine engine and marine boiler experts, etc.) along with regulatory agencies (CARB, USCG, CSLC, BCDC, IMO, etc.), to assess and document the applicability, safety, reliability, cost-effectiveness and operability of potential candidate vessel- and land-based capture and/or control strategies.
- (2) Identification of unique characteristics of affected terminals and Ro-Ro and tanker ship classes that may affect the applicability, safety, reliability, cost-effectiveness and/or operability of each candidate vessel- and land-based capture and/or control strategy.
- (3) A final determination regarding the applicability, safety, reliability, cost-effectiveness and/or operability of each candidate vessel- and land-based capture and/or control strategy, and identification of the criteria employed to make that determination.
  - (A) For each technology determined to be feasible, a full hazard and operability study (HAZOP) shall be conducted on the identified technology, and the feasibility study shall propose a set of design standards that will comply with MOTEMS and other existing regulations, and that can support the full development of the technology.
  - (B) If no technology is determined to be feasible, identify the specific requirements and/or changes (if any) which will need to be met before the technology can be considered feasible.

(e) Results of the interim evaluation for tanker and Ro-Ro technology.

- (1) If a technology or set of technologies is determined to be feasible, CARB staff in consultation with the third party marine engineering firm will assess the compliance deadlines in this Section to determine if adjustments need to be made. CARB staff shall initiate formal rulemaking to adjust the deadlines in this Section if it is determined that

the technology cannot be implemented under the current schedule. If staff finds that the compliance deadlines for ro-ro or tanker vessels need to be extended, the report will include recommendations to initiate staff's development of potential formal regulatory amendments.

(2) If no technology is determined to be feasible, CARB staff will initiate formal rulemaking to exempt or exclude Ro-Ro and/or tanker vessels from this Section of the regulation.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.15 Remediation Fund Use**

This section sets forth an additional compliance option which may be used under limited circumstances where vessels and/or terminal operators have made certain enforceable commitments to controlling emissions at berth. Even if the emissions are not controlled for all or part of a vessel visit, under certain circumstances, a vessel may qualify to remediate emissions, as set forth in this section.

- (a) For a vessel or terminal operator to utilize the remediation fund, a remediation fund administrator must be established with a Memorandum of Understanding executed with CARB under section 93130.16 of this Control Measure to manage the funds generated at that port or independent marine terminal.
- (b) Vessel operators, terminal operators, and ports may request to use the remediation fund option in the following circumstances, if the request is supported by compelling documentation that demonstrates the eligibility of the request, consistent with the criteria in this section, as determined by CARB.
  - (1) Terminal equipment repairs – a terminal has invested in shoreside control equipment, and maintains that equipment according to manufacturer recommendations, but that equipment has failed and is being repaired, or new or replacement equipment has been ordered in a timely manner, but has not been received.
  - (2) Vessel equipment repairs -- a vessel operator has invested in shore power or other on-board control equipment, and maintains that equipment according to manufacturer recommendations, but that equipment has failed and is being repaired, or new or replacement equipment has been ordered in a timely manner, but has not been received.
  - (3) Delays with operation of existing control strategy – a vessel visits a berth and all parties have taken the required actions to use a CARB-approved control strategy, but the visit fails to achieve the

full emission reductions required under section 93130.5 of this Control Measure due to a delay or interruption in controlling emissions. If CARB-approved emission control strategy operator is under contract to reduce emissions from that vessel visit and a malfunction causes or contributes to a delay or interruption in emissions control, that operator must have notified CARB of the malfunction according to the provisions of section 93130.12(b)(4) of this Control Measure for that visit to be eligible to use the remediation fund for the uncontrolled hours of the visit.

- (4) Terminal construction project – a terminal has invested in shoreside control equipment, and maintains that equipment according to the manufacturer recommendations, but takes that equipment out of service to allow a planned terminal upgrade or construction project that cannot safely be performed with the terminal side control equipment operating.
  - (5) A terminal plan deemed acceptable under section 93130.14(c) of this Control Measure identifies a physical and/or operational constraint that is delaying the implementation of a CARB-approved emission control strategy at the terminal.
- (c) For excess vessel emissions that are otherwise required to be reduced under section 93130.5 of this Control Measure, the vessel operator, terminal operator, or port may elect to request use of the remediation fund option for each hour of uncontrolled emissions during a vessel visit if all of the criteria in this section 93130.15 of this Control Measure are met. Such request shall be submitted to CARB electronically within 7 calendar days of the vessel's departure, according to the requirements of section 93130.7(e) for vessel operators, section 93130.9(d) for terminal operators, and section 93130.13 for ports.
  - (d) For each request to use the remediation fund option, CARB shall evaluate the request to determine if the requirements of this section have been met and the request is eligible. If the party requesting use of the remediation fund option fails to adequately support its eligibility for that option based on the criteria in subsection (c), above, to CARB's satisfaction, then CARB may deny that request. Within 30 calendar days of receipt of each request, CARB shall notify the requestor whether the visit or visits are eligible to use the remediation fund option. Ineligible requests to use the remediation fund for a vessel visit shall result in that visit being considered non-compliant with this regulation.
  - (e) Within 30 calendar days of CARB's determination of eligibility, the requestor shall transfer a sum equal to the number of hours of excess emissions times the applicable hourly payment to the CARB-approved fund administrator, according to the specific payment provisions established by that administrator in its Memorandum of Understanding with CARB. Each partial hour of excess emissions shall be counted as full hour for the purpose of calculating the payment. These

payments are intended to cover the administrator’s cost to achieve emission reductions through incentive activities in the communities exposed to the excess emissions, including 10 percent for administration expenses.

- (f) Remediation fund hourly amount.

<b>Table 4: Remediation Fund Hourly Amount</b>		
<b>Vessel Type</b>	<b>Hourly Remediation Payment Beginning in 2021*</b>	
	<b>Normal Rate</b>	<b>Tier III Rate</b>
<b>Container, Reefer, Ro-ro</b>	\$1,900	\$1,100
<b>Tanker with electric pumps</b>	\$1,600	\$1,000
<b>Tanker with steam driven pumps</b>	\$3,400	\$2,700
<b>Passenger vessels with capacity under 1,500 combined passengers and crew</b>	\$5,300	\$3,200
<b>Passenger vessels with capacity of 1,500 or more combined passengers and crew</b>	\$12,000	\$7,100
* Remediation payments used by vessel operators shall be reduced by 20 percent for IMO Tier III tanker vessels with steam driven pumps, and 40 percent for all other IMO Tier III vessels.		

- (g) Prior to the beginning of each odd numbered calendar year, the hourly remediation payment amounts set forth in this section shall be adjusted by considering the current Consumer Price Index values published by the Bureau of Labor Statistics relative to 2019, to determine the hourly remediation payment amounts for that calendar year and the subsequent year. CARB shall post any updates to the hourly remediation payment on its website.
- (h) For requests to use the remediation fund option for multiple vessel visits over an extended time period, the requestor may seek a prospective eligibility determination from CARB before the relevant visit occurs. Upon CARB’s determination of eligibility, the requestor shall report data on each vessel visit within the required 7 days, and shall make payments at least monthly to the remediation fund administrator until the equipment is operational again and payments have been made for all uncontrolled vessel visits.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

**Section 93130.16. Remediation Fund Administration.**

This section sets forth the criteria for CARB approval of an entity to administer a

remediation fund for individual ports and independent marine terminals, and the requirements for approved administrators to manage those funds. The intent of the remediation fund is to mitigate the community impact of the excess emissions from vessel visits that did not reduce emissions at berth to the required levels, as set forth under section 93130.15. It is CARB's intention that the monies from the remediation fund achieve emission reductions not otherwise required by law or regulation by funding incentive activities that comply with adopted CARB guidelines on existing incentive programs.

- (a) CARB staff shall notify, in writing, the local air quality management districts and air pollution control districts with jurisdiction in the communities adjacent to covered ports and independent marine terminals of the opportunity to apply to administer the remediation funds.
- (b) Each district may elect to submit a written application, within 120 calendar days of notification, to the Executive Officer to administer remediation funds for that district's geographic area.
- (c) Applications shall include the following information:
  - (1) Description of the applicant's experience implementing incentive programs for heavy-duty diesel vehicles and off-road equipment, with a focus on the Carl Moyer Program, Proposition 1B Program, or Community Air Protection Incentives, or similar programs for mobile and/or stationary sources of air pollution.
  - (2) Technical knowledge of engines, vehicles, equipment, and/or stationary air pollution sources that would be eligible for incentives.
  - (3) Remediation activity types and applicable CARB incentive program guidelines the fund administrator will use to recruit, evaluate, select, fund and track incentive activities.
  - (4) Demonstration of the applicant's capacity to administer the fund, including: personnel resources; operating budgets; accounting and legal support; activity tracking, emission reduction quantification, reporting mechanisms, and outreach experience.
  - (5) The ability to establish a separate account, and track deposits and payments, solely for the remediation fund.
  - (6) The proposed timeline for recruiting and funding incentive activities, and for those activities becoming operational to reduce emissions, once remediation funds are deposited into the applicant's separate account. For efficiency, these milestones may be aligned with existing solicitations, obligation, and liquidation deadlines for other incentive programs.
- (d) CARB shall review submitted applications to determine whether the applicant is eligible and all required information is included in the application. CARB shall verify that:

- (1) The applicant is eligible to administer a remediation fund based on the criteria in subsection (c) above;
  - (2) The application is complete, the responses demonstrate the applicant's capacity to successfully administer the remediation fund to the satisfaction of CARB; and
  - (3) The application includes a resolution from the applicant's governing board authorizing the applicant to participate in the remediation fund program.
- (e) If CARB determines that the conditions in subsection (d) above have been met, CARB will notify the applicant and execute a Memorandum of Understanding with the applicant to enable the applicant to serve as the remediation fund administrator for ports and independent marine terminals in that air district's geographic area.
- (f) If the air district with jurisdiction in the region that includes a covered port or independent marine terminal does not execute a Memorandum of Understanding with CARB to administer the remediation fund, CARB may invite non-profit organizations in the region with the demonstrated capacity and substantial experience administering incentive programs to apply. Any invited organization that wishes to participate must demonstrate no conflict of interest with the intended purpose of the remediation fund. CARB may approve a non-profit organization as the remediation fund administrator following the procedures and requirements of this section.
- (g) CARB will post executed Memoranda of Understanding, and each successful applicant's application, on its public website.
- (h) Each Memorandum of Understanding shall include the following minimum elements:
- (1) Parties, contact information, effective date and term.
  - (2) Environmental justice: The fund administrator agrees to conduct its programs in a manner that ensures the fair treatment of all people in the State.
  - (3) Emission reductions: The fund administrator agrees to use remediation funds for incentive activities that directly benefit communities impacted by excess emissions from the port or independent marine terminal, and achieve emission reductions consistent with CARB's most recent applicable incentive program guidelines for: Carl Moyer Program, Proposition 1B: Goods Movement Emission Reduction Program, or Community Air Protection Incentives. Fund administrators shall seek to prioritize eligible activities in communities that are also identified by CARB under the AB 617 Community Air Protection Program or disadvantaged communities as defined by the Secretary for Environmental Protection. While at berth remediation funds can be administered as part of an existing incentive program, the

remediation funds cannot be used in place of any required match funding.

- (4) Incentive activity types and applicable guidelines: The fund administrator agrees to recruit, evaluate, select, fund and track incentive activities in conformance with the requirements of the applicable guidelines for the incentive program or programs identified in the application.
- (5) Schedule: The fund administrator will identify anticipated major milestones for implementing emission reduction projects once remediation monies have been received by the administrator.
- (6) Reporting requirements: The fund administrator is responsible for submitting to CARB semi-annual reports covering fiscal activity and remediation activities funded, including, but not limited to, recipient, type, location, and estimated emission reductions achieved.
- (7) Recordkeeping requirements: The fund administrator agrees to retain fund records, e.g., solicitations, applications, invoices, contracts, and correspondence, for 3 years after activity completion.
- (8) Oversight: The fund administrator agrees to allow ongoing evaluations, reviews, and fiscal audits by CARB, other State agencies, or their designees.
- (9) Records access: The fund administrator agrees to allow CARB or its designees access to evaluate or audit fund records.
- (10) Enforcement: The fund administrator authorizes CARB or its designee to inspect incentive activities to ensure compliance with CARB requirements.
- (11) Administration expenses: The fund administrator may retain up to 10% of the remediation funds collected for its direct and reasonable expenses incurred to implement the incentive program.
- (12) Earned interest: The fund administrator agrees to maintain records and report on interest earned on remediation funds, and to expend earned interest according to the provisions of the MOU.
- (13) Non-performance provisions: The fund administrator agrees that the following is a non-exhaustive list of the circumstances that constitute non-performance under this MOU. These circumstances include, but are not limited to:
  - (A) Failure to comply with the provisions of this Control Measure for remediation fund administrators or the CARB-approved guidelines of the applicable incentive programs.
  - (B) Failure to obligate or expend remediation funds within established timelines, or to show timely interim progress to meet these timelines.

- (C) Insufficient performance or widespread deficiencies with remediation fund oversight, enforcement, record keeping, contracting provisions, inspections, or any other fund element as determined by CARB.
  - (D) Misuse of remediation funds.
  - (E) Funding of ineligible incentive activities or other items.
  - (F) Exceeding administration fund allotment.
  - (G) Insufficient, incomplete, or faulty incentive activity documentation.
  - (H) Failure to provide required documentation or reports requested from CARB, or other State agencies, in a timely manner.
  - (I) Poor performance as determined by a review or fiscal audit.
- (14) Remedies: The fund administrator agrees to provisions to remedy non-performance, including:
- (A) A corrective action plan.
  - (B) Transfer of collected remediation monies to an alternative fund administrator identified by CARB.
  - (C) Constraints on opportunity to administer future remediation funds.
  - (D) Termination of the Memorandum of Understanding.
- (15) Indemnification: The fund administrator agrees to indemnify and hold harmless the State for any liability arising out of the performance by the fund administrator.
- (16) Entitlements: The fund administrator agrees to comply with all laws, ordinances, regulations, and standards in administering remediation activities, including by obtaining any permits or approvals necessary to undertake the activities funded by the remediation fund, and complying with all environmental review requirements associated with such activities.
- (17) Severability: The remaining provisions of an agreement continue in effect even if a court holds a specific provision invalid.
- (18) Force majeure: CARB and fund administrator are not liable for any delay or failure in performance resulting from war, natural disasters, and other acts beyond their control.
- (19) Amendments: The amendments shall only occur by mutual agreement in writing and signed by all parties.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

## **Section 93130.17 Summary of Responsibilities.**

This Control Measure has shared responsibilities between all parties involved in reducing emissions from ocean-going vessels. The following table outlines a summary of responsibilities and how the terminal or vessel operator can apply exceptions, VIEs, TIEs, and remediation fund.

<b>Table 5: Summary of Responsibilities</b>				
<b>Circumstances that may qualify for a VIE/TIE or remediation</b>				
<b>Circumstances</b>	<b>Exception</b>	<b>VIE/TIE</b>	<b>Remediation Fund</b>	<b>Responsible Parties</b>
<b>Safety/emergency, research, or vessel commissioning</b>	X			
<b>Visits without reductions</b>		X	*	Terminal, Vessel
<b>Vessel control equipment repair</b>		X	X	Vessel
<b>Terminal control equipment repair</b>		X	X	Terminal, Port
<b>Terminal upgrades/construction</b>		X	X	Terminal, Port
<b>Delays, but reduction occur</b>		X	X	Terminal, Vessel
<b>CAECS failure</b>		X	X	Vessel, CAECS operator
*In general, all visits may use a VIE or TIE if available, but not all visits qualify for remediation. See section 93130.15(b) of this Control Measure				

<b>Table 5: Summary of Responsibilities (Continued)</b>		
<b>Circumstances that will be evaluated for non-compliance</b>		
<b>Circumstances</b>		<b>Responsible Parties</b>
<b>Berth</b>	<b>Vessel</b>	
<b>Has shore power</b>	<b>Does not have shore power</b>	Vessel
<b>No shore power, but has other CAECS</b>	<b>Has shore power</b>	Terminal, Port
<b>No shore power, but has other CAECS</b>	<b>Does not have shore power</b>	Terminal, Port, Vessel
<b>Has other CAECS</b>	<b>No shore power, but doesn't allow CAECS</b>	Vessel

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.18 Violations.**

- (a) Any person subject to this Control Measure who fails to comply with any provision, prohibition, limit, standard, criteria, or requirement in this Control Measure is subject to the penalties, injunctive relief, and other remedies specified in Health and Safety Code sections 38580, 39764, 42400 et seq., 43016, other applicable sections in the Health and Safety Code, and other applicable provisions as provided under California law for each violation. Nothing in this Control Measure shall be construed to limit or otherwise affect any penalties or other remedies available under federal law.
- (b) Any failure to meet any provision, prohibition, limit, standard, duty, criteria, or requirement in this Control Measure shall constitute a single, separate violation of this Control Measure for each day that a vessel operates without using a CARB approved emission control strategy.
- (c) Violating the recordkeeping or reporting requirements in this Control Measure shall constitute a single, separate violation of this section for each day that the applicable recordkeeping or reporting requirement has not been met.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 39674, 41510, 41511, and 43016, Health and Safety Code.

### **Section 93130.19 Sunset.**

The requirements specified in this Control Measure shall cease to apply if the United States adopts and enforces requirements that will achieve emissions reductions within the Regulated California Waters equivalent to those achieved by this Control Measure. Equivalent requirements may be from IMO regulations adopted and enforced by the United States, or may be contained in regulations adopted or enforced by the United States Environmental Protection Agency. This Control Measure shall remain in effect until the Executive Officer issues written findings that federal requirements are in place that will achieve equivalent emissions reductions within the Regulated California Waters and are being enforced within the Regulated California Waters.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

### **Section 93130.19 Severability.**

If any section, paragraph, subparagraph, sentence, clause, phrase, or portion of this Control Measure is held invalid, unconstitutional, or unenforceable by any court of competent jurisdiction, such portion shall be deemed as a separate, distinct, and independent provision, and such holding shall not affect the validity of the remaining portions of the Control Measure.

Note: Authority cited: Sections 38560, 38562, 39600, 39601, 39658, 39659, 39666, 43013, and 41511, Health and Safety Code. Reference: Sections 38510, 38530, 38562, 38566, 38580, 39600, 39650, 39658, 39659, 39666, 41510 and 41511, Health and Safety Code.

MEETING  
STATE OF CALIFORNIA  
AIR RESOURCES BOARD

DEFREMERY PARK RECREATION CENTER  
1651 ADELIN STREET  
OAKLAND, CALIFORNIA

THURSDAY, DECEMBER 5, 2019  
10:00 A.M.

JAMES F. PETERS, CSR  
CERTIFIED SHORTHAND REPORTER  
LICENSE NUMBER 10063

1 includes an interim evaluation in 2023. So staff have set  
2 ambitious implementation timelines for realizing the  
3 health benefits of this regulation as early as possible,  
4 but we also realize there may be some uncertainty with  
5 adapting these technologies for new vessel types and also  
6 with the infrastructure developments that may be required.

7 Now you may hear today that technology does not  
8 exist for ro-ro and tanker vessels or that staff's  
9 proposed timelines are too aggressive.

10 Now, technology manufacturers have assured CARB  
11 staff that there are engineering solutions for both ro-ro  
12 and tanker vessels. And shore power has actually been  
13 used on tanker vessels here in California.

14 And while there are no current capture and  
15 control projects that are occurring yet for ro-ro and  
16 tanker vessels in California, staff have been able to  
17 analyze multiple terminal infrastructure projects really  
18 to assess the timelines that are required to complete  
19 existing projects. And we feel the timelines that are  
20 proposed here are aggressive but feasible.

21 However, to address the uncertainty of the  
22 timelines for these new vessel types, CARB staff propose  
23 an interim evaluation in 2023 to assess the progress of  
24 adapting technology for new vessel types and also the  
25 necessary infrastructure improvement projects that might

1 based on the fact that it would have to meet some  
2 emissions level. And so it doesn't prescribe that a  
3 tanker would have to use shore power, or the bonnet  
4 system, or on-board. It is flexible in that manner.

5           So we would, at this point, as I think Nicole  
6 mentioned and there's a picture in one of the slides is  
7 that shore power has been and is in use at a terminal in  
8 Long Beach at T121. And so it's -- it is demonstrated to  
9 be effective for tankers. We up here do not want to  
10 downplay the role of safety for tankers for any vessel  
11 categories. And so safety is going to be the important  
12 concern with any emission control technology. And any of  
13 the technologies will have their own specific components  
14 that will have to be designed with safety in mind.

15           And so currently, we think that the two probably  
16 most likely technologies are either the capture and  
17 control systems. And those are effective because there  
18 doesn't have to be any vessel infrastructure done, right?  
19 A vessel can show up that doesn't have any shore power  
20 infrastructure on the vessel and it can be controlled.

21           And so that, I think, is one reason why we  
22 consider the capture and control systems likely for  
23 tankers. But tankers could use a combination of, say for  
24 example, cleaner tier 3 engines that are coming up in the  
25 future with maybe a diesel particulate filter on board.

1 comments to the docket on this item will remain open until  
2 December 9th, 2019. After that date, if it's determined  
3 that additional modifications are appropriate, the record  
4 will be reopened and a 15-day Notice of Public  
5 Availability will be issued. And the staff has already  
6 indicated that they do intend to do that.

7           So it will be reopened, and there will be another  
8 15-day Notice of Availability, and then the public may  
9 submit more written comments on proposed changes, which  
10 will be considered and responded to in the Final Statement  
11 of Reasons for the regulation.

12           Written comments that are received after December  
13 9th, but before the notice -- the 15-day notice is issued  
14 do not get considered as part of the official record. So  
15 I think in plain English what that means is this  
16 regulation is going to come back to the Board with some  
17 proposals for amendments included. We don't have a date  
18 second -- set for that yet, but we certainly heard a lot  
19 of testimony that people would like that to be sooner  
20 rather than later. And I hope that the staff can do its  
21 work expeditiously, so that we can -- so that we can hear  
22 it quickly.

23           Now, before we turn to the resolution that's  
24 before the Board, I want to ask for Board members who have  
25 additional comments on what they've heard to speak. And

March 20, 2020

Jared Blumenfeld, Secretary  
California Environmental Protection Agency  
1001 I Street  
Sacramento, California 95812

Mary Nichols, Chair  
California Air Resources Board  
1001 I Street  
Sacramento, CA 95812

**Subject: Impact of COVID-19 on At-Berth Regulatory Schedule**

Dear Secretary Blumenfeld and Chair Nichols:

The spread of COVID-19 is disrupting the entire world. The impact has been particularly difficult to manage in an industry based upon the international movement of goods and people. Necessary precautions to address COVID-19 have already made compliance with the existing At-Berth Rule difficult and, at times, impossible. Travel bans and self-quarantines have already kept key personnel from reaching vessels and terminals. Many vessel sailings were cancelled from China and vessel schedule will take months to restabilize. Here in the United States, while we are still in the early stages of the spread of this disease, industry has already documented to your staff the many instances of our inability to conduct routine maintenance, repairs, or vessel commissioning as a result of COVID-19 restrictions.

In addition to the challenges that this public health crisis poses to industry compliance with the existing shorepower regulation, we will also be impacted with respect to promulgation of a new proposed rule. We appreciate that your staff has already delayed the release of the 15-Day package for the At Berth amendments and is considering extending deadlines for comments. Unfortunately, that is not enough. Based on the recent study from Imperial College London, this outbreak will not subside for months with the peak in the United States not reached until June 2020. As a result of the extraordinary disruptions to normal business operations associated with this crisis, it will be impossible for the regulated community, spread across the world, already dealing with limitations with respect to our ability to comply with the current regulation to also participate in the rulemaking process for months.

With respect to implementation, it is unclear when personnel and vendors will be able to travel again to begin making necessary improvements to comply with the requirements of any amended rule. The proposed rule compliance date was already very aggressive, and our Coalition has consistently and repeatedly raised concerns that compliance was infeasible even under the best of circumstances due to the operational and infrastructure changes to be implemented.

As a result of the COVID-19 circumstances described above and in anticipation of other extenuating factors arising from this crisis that may come to light in the coming months, we respectfully request that the regulatory schedule be paused until January 2021 when this crisis is over and its full impacts have been assessed.

We look forward to continuing our good working partnerships and positive relationships with the Agency and the Air Resources Board during these trying times.

Sincerely,

**California Association of Port Authorities  
Pacific Merchant Shipping Association  
World Shipping Council**

**Cruise Lines International Association  
Western States Petroleum Association**

March 24, 2020

Jared Blumenfeld  
Secretary  
California Environmental Protection Agency  
1001 I Street  
Sacramento, California 95812

Mary D. Nichols  
Chair  
California Air Resources Board  
1001 I Street  
Sacramento, California 95812

Secretary Blumenfeld and Chair Nichols:

On behalf of the California Association of Port Authorities (CAPA) and the International Longshore and Warehouse Union (ILWU), we are writing to request a pause in the development of the currently pending At-Berth regulatory package. Our industry and workers are currently managing the COVID-19 crisis, which has resulted in a shelter-in-place order for the State of California. As our state manages the current health crisis, the health and safety of our communities and of the critical workers, who continue to work to keep goods moving through the supply chain, is our top priority.

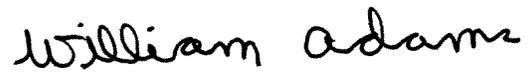

CAPA represents the eleven public seaports in California, including three of the largest container ports in the nation – Los Angeles, Long Beach and Oakland – as well as eight smaller ports situated along the coast from Humboldt to San Diego, and along inland waterways in West Sacramento and Stockton. The ILWU was formed by dockworkers in 1934 and represents 40,000 men and women in Oregon, Washington, California, Alaska and Hawaii, on the docks and in other industries.

Given the current crisis, we request that the At-Berth regulatory package process be delayed until January of 2021. This pause would afford ports and port workers time to get through the COVID-19 outbreak and navigate its economic impacts prior to enacting a regulatory change that could complicate economic recovery. COVID-19 is changing the tourism and goods movement industry in ways that we do not yet fully comprehend; it would be appropriate to consider these changes into the rulemaking process. For example, the Port of San Diego has already experienced a precipitous drop in revenues related to the complete halt of the tourism industry with a projected fiscal year end (June 31, 2020) deficit of \$30 million. Of course, the halt of the tourism industry also means a significant drop in work for port workers.

CAPA and ILWU desire a strong partnership with CARB to reduce emissions, improve the environment, and maintain jobs. We remain committed to these shared goals and we are merely asking for a pause in a pending regulatory process during this unprecedented health crisis. Therefore, we request a pause in the At-Berth regulatory process until January of 2021 in order to focus on the current pressing issues and

for all parties to better understand the long-term shifts that will be occurring in the tourism and goods movement industries. Thank you for your consideration.

Sincerely,

Chairman  
California Association of Port Authorities

April 15, 2020

The Honorable Gavin Newsom  
 Governor, State of California  
 State Capitol  
 Sacramento, CA 95814

Dear Governor Newsom:

We deeply appreciate your aggressive leadership responding to the coronavirus pandemic. The business community is also helping where possible by providing essential services, having employees work remotely, and of course providing support for our workers and communities. Like you, our businesses are keenly focused on meeting this crisis and finding a path to recovery. The interconnectedness of our economy and its supply chains means the reverberation of shutting down public gatherings and non-essential outings has been felt by every Californian.

You have already taken preliminary actions to mitigate some of the burdens on individuals and private employers as they deal with the vast economic consequences, including directing tax agencies to delay the income tax filing deadlines and suspending the California WARN act for employers who have unexpectedly been required to shut down their businesses with little notice. We are grateful for these efforts so far but

believe there is much more to be done to ease the economic pain being visited on employers and their workers throughout the state.

Our organizations recommend the Administration urgently act to pause non-essential state regulatory functions that will not impact measures designed to protect imminent harm to human health. Specifically, we urge you to issue an Executive Order temporarily suspending all pending new rulemaking, as well as any rules or amendments first taking effect after your stay-at-home order of March 19, 2020, not urgently needed to protect public health, for all state agencies and commissions for at least six months.

Since public participation is an integral part of the development of new regulations and proposed rules, regulators must protect due process rights of regulated entities and the public. As businesses direct their focus to providing essential services and protecting their workforce, they will lose the capacity to meaningfully contribute to draft regulations or proposals from state agencies, boards, and commissions. Nor is there an accessible platform for stakeholders to participate on a virtual basis that is also equipped to accommodate widespread public comments or participation.

We are aware of the following agencies that are still moving forward with proposed rulemaking, which can be postponed during this emergency without affecting public health and safety, or the state's response to the COVID-19 crisis. As we become aware of others, we will advise you.

- Draft Supplemental Guidance by the Department of Toxic Substances Control: Screening and Evaluating Vapor Intrusion, for which public comment is due April 30.
- Department of Fish & Wildlife Commission - Petition to List the Southern California/Central Coast Evolutionarily Significant Unit (ESU) of Mountain Lions as Threatened under the California Endangered Species Act (CESA), submitted by the Center for Biological Diversity and the Mountain Lion Foundation – Hearing April 16.
- California Department of Housing and Community Development (HCD) - Multifamily Housing Program (MHP) 2020 Draft Guideline amendments: Comments deadline May 5.
- Air Resources Board (ARB) - Vessels at berth regulation: Comments deadline May 1.
- ARB Transportation Refrigeration Unit regulation: Comments deadline April 27 (extended 30 days from March 27)
- ARB Advanced Clean Trucks: Expected public comment deadline approximately week of May 11-22.
- ARB Public Hearing on adoption of the proposed amendments to the Regulation on the Commercialization of Alternative Diesel Fuels (ADF) – April 23.
- State Water Resources Control Board (SWRCB) Microplastics in Drinking Water: Comments deadline April 24. On Board agenda 6/16/20.
- SWRCB Hexvalent Chromium MCL Staff workshop 4/27/20: Comments deadline May 15.
- SWRCB Drinking Water Fees: Comments deadline May 15.
- Water Board Once Through Cooling Extensions: Comments deadline May 11.
- CalRecycle – SB 1383 Regulatory Language – Comments deadline May 20.

Employers should also have an extended period of time to implement regulations that have not yet taken effect, for at least 90 days following the end of both a local and statewide shelter-in-place order. We are aware of the following upcoming regulations and will advise of others as we become aware:

- CEQA guidelines adopted by the Natural Resources Agency implementing SB 743 changes on analysis and mitigation of VMT thresholds.
- Suspend the enforcement of AB 827 that is set to take effect July 1, 2020, as it applies to amusement parks. Before the Legislature went into emergency recess, the author of AB 827 was moving rapidly his clean-up urgency legislation, AB 1506, to clarify application of the original bill. With the Legislature on indefinite recess, amusement parks would be expected to spend substantial sums for compliance – even if not open for business;
- California Consumer Privacy Act regulations, set to take effect July 1, 2020.

- State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State – implementation date May 28, 2020.

We believe that Californians' health and safety will not suffer from a pause in these regulatory processes, and that state regulators can accommodate these changes to their schedules. We appreciate your urgent attention to this matter.

Sincerely,

A handwritten signature in black ink, appearing to read 'Allan Zaremberg', with a large, stylized flourish extending to the right.

**Via Electronic Delivery**

The Honorable Gavin Newsom  
Governor, State of California  
State Capitol Building  
Sacramento, CA 95814

**Subject: Request for Postponement of Deadlines for Pending Policy and Regulatory Initiatives.**

Dear Governor Newsom,

The undersigned organizations thank you for your leadership in guiding California through the uncharted territory of the COVID-19 pandemic. We appreciate the open lines of communication your administration has maintained to address emerging problems in real time. This unprecedented public health crisis requires all parties to work together for the greater good of California and its citizens.

We write you now asking you to direct all state agencies to postpone near-term rulemaking and related deadlines to allow a reasonable period of time for meaningful public participation in decision making processes. We also ask that you direct state agencies to be judicious in exercising enforcement authority while businesses make unprecedented changes to their operations to help reduce the spread of the virus.

The business community has been working diligently to adapt to shelter in place orders. Businesses that are still in operation have reduced staffing levels to comply with social distancing guidelines and other health-related measures. Employee focus has necessarily been diverted from normal workload to COVID-19 response. A "business as usual" approach from state regulatory agencies conflicts with the administration's directives to focus limited resources on protecting employee health and safety while continuing to provide essential goods and services to the public.

Many rulemaking and policy development initiatives were either launched or already in process at the front end of the COVID-19 crisis. As the following few examples attest, several of the pending deadlines pertain to environmental and workplace-related initiatives:

- Cal-Recycle SB 1335 Implementation: Cal-Recycle is in the process of developing regulations for determining the types of food service packaging that are reusable, recyclable, or compostable. Cal-Recycle opened a formal comment period on March 13 which is scheduled to close on April 28.
- State Water Resources Control Board Economic Feasibility Guidance: The SWRCB issued a "White Paper" on Evaluation of Economic Feasibility as the first step in developing a new drinking water standard for hexavalent chromium. The White Paper was released on March 6 with a comment deadline of April 27. The SWRCB also announced three public workshops scheduled for mid-April. This guidance is expected to set precedents for all future state drinking water standards.
- Air Resources Board Transport Refrigeration Unit, Commercial Harbor Craft, and Vessels At-Berth Regulations: The public comment deadlines on these multiple

proposed amendments to existing regulations on our state's "essential service" supply chain were extended to April 27, April 30, and May 1, respectively. All the critical supply chain functions provided by these freight sectors are essential to the delivery of medical equipment, pharmaceuticals, fresh foods and other vital products currently in short supply.

- Cal-EPA Supplemental Vapor Intrusion Guidelines: This draft guidance, which could have significant negative impacts on in-fill development and affordable housing projects, was issued in mid-February. Public workshops originally scheduled for early April have been postponed until further notice and the public comment deadline extended by 30 days to June 1.
- Office of Environmental Health Hazard Assessment Public Health Goals: OEHHA announced on March 27 that it is initiating development of PHGs for 1,4 dioxane and NDMA in drinking water with a solicitation for scientific information on health effects. This notice indicates an April 27 deadline for public comments.
- Cal-OSHA Indoor Heat Illness Prevention Regulations: Cal-OSHA is nearing completion of work required by the Office of Administrative Law to approve a notice of proposed rulemaking, which would commence a 45-day public review and comment period. As currently drafted, this proposed regulation will impact thousands of businesses statewide.

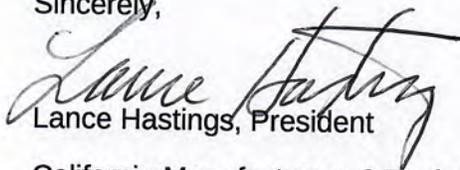

Continuing to advance new regulatory initiatives in the current environment will undermine public participation and lead to poorly informed decisions that may present unintended and undesirable consequences. While the extensions granted to date are appreciated, they are being issued on a piecemeal basis and are inadequate given uncertainty about the duration of the crisis. Therefore, in recognition of the overwhelming impact of the COVID-19 response effort, all pending regulatory proceedings including informal pre-rulemaking activities should be postponed for a reasonable period of time after shelter in place orders are lifted.

In addition to regulatory initiatives, some industries such as food production and processing, continue to receive 60-day notices of intent to sue under Proposition 65. The Attorney General should recognize that many businesses are uniquely vulnerable to predatory litigation practices while they focus on responding to the COVID-19 crisis and should prioritize these cases for state intervention.

The undersigned groups want to make clear that we are simply seeking a short-term stay in state regulatory agendas while we do our part to support California's response to this public health crisis. We remain committed to working with the state toward practical and sustainable regulations and to meeting existing regulatory requirements to the maximum extent feasible.

Thank you again for your time and continued leadership in these difficult times. We appreciate your consideration of our urgent requests. Please contact me if you have any questions at [lhastings@cmta.net](mailto:lhastings@cmta.net) or (916) 527-4334.

Sincerely,

# CALIFORNIA LEGISLATURE

STATE CAPITOL  
SACRAMENTO, CALIFORNIA  
95814

April 21, 2020

Mary D. Nichols, Chair  
California Air Resources Board  
1001 I Street  
Sacramento, CA 95814

Re: Rulemaking Impacting Essential Services Freight Transportation

Dear Chair Nichols,

The COVID-19 crisis has posed a fundamental threat to California's public health and our economy. In light of the economic impacts of this extraordinary event, it is imperative that the state government not only commit to slowing the spread of the virus, but also take the steps needed to protect our state's economy and employment opportunities for our working families.

Preserving the operations of our freight transportation system will be key to protecting our economy, keeping medical supplies moving, and ensuring that products are available on our store shelves during this unprecedented crisis. We thank Governor Newsom for recognizing that our goods movement industry and supply chains are "essential services" that must remain up and running during the pandemic. Without a fully functioning supply chain, we risk disrupting the delivery of critical medical supplies, the distribution of groceries, and billions of dollars in personal income, job opportunities, and tax revenue.

**As such, we request that the California Air Resources Board (CARB) put all current and proposed rulemakings regarding freight transportation and harbor craft on hold until January 2021.** This will ensure that the state can focus our essential transportation assets on delivering critical goods and providing transportation mobility options during this crisis.

We share CARB'S goal of protecting our air quality and the belief that we must base any new regulations on science, facts, air quality modeling, cost-effectiveness, and minimizing any negative impact on the statewide economy.

Over the past several weeks, COVID-19 has fundamentally transformed life as we know it in California, and it may take several months after the conclusion of this crisis before we can understand what the new baseline of our economy and environment will look like. Therefore, it is necessary for regulators to pause and reevaluate any proposed regulations based on our new reality once the crisis has subsided.

We are hopeful that by January 2021, we can evaluate COVID-19's impact on our state and work together to achieve the best environmental and economic outcomes for all Californians.

Sincerely,

## Tab 8

April 27, 2020

Ms. Catherine Reheis-Boyd  
President  
Western States Petroleum Association  
1415 L Street, Suite 900  
Sacramento, CA 95814

Dear Ms. Reheis-Boyd:

This letter is in response to your request that our firm evaluate the effects of the COVID-19 pandemic on the estimates in the California Air Resources Board (CARB) Standardized Regulatory Impact Assessment (SRIA) of the *Ocean-Going Vessels at Berth* proposal, as modified by the “15-day changes” document released on March 26, 2020.

### **Background and Proposed Regulation**

The proposed regulation would expand the type and number of ships that must use shore electrical power or an alternate recapturing method to reduce emissions while at berth. Existing rules require most container ships, refrigerated ships and cruise ships to use shore power when docked in ports rather than run their auxiliary engines to create electricity for lighting, air conditioning or operation of shipboard equipment. Alternatively, these ships can continue to use auxiliary engines but then must connect to an on-shore or barge-based capture and control system. The current regulations are in place at six ports: Los Angeles, Long Beach, Oakland, San Diego, San Francisco and Hueneme.

Key provisions of the proposed regulation (as modified by the 15-day changes) would:

- Make smaller container, reefer and cruise ships subject to the shore power regulation. Those requirements would phase-in beginning in 2021.
- Make roll-on/roll-off (ro-ro) ships subject to the shore power regulation starting in 2024.
- Expand the requirement to include tankers beginning in 2025 at the Los Angeles and Long Beach terminals, and elsewhere in 2027. In addition to auxiliary engines, the proposal would require large tankers to reduce emissions from boilers used to power steam-driven pumps involved in offloading crude oil, unless shore power is installed.

- Expand the ports and terminals covered in the regulations. Ports, including refinery docks, in Northern California in or near cities such as Stockton, Richmond, Rodeo, Benicia and Martinez, would now be covered.
- Allow vessel and terminal operators to meet berth emission reduction requirements through an approved “innovative concept.” The concept, which according to CARB would most likely be used at smaller ports, allows vessel or terminal operators to achieve targeted emissions savings through an alternative project. These concepts would only qualify to the extent they are not required by regulation, including future regulations and AB617 Community Emission Reduction Plans.

## CARB Estimates of the Proposal’s Impact

CARB estimates that the proposed regulation would have the following impacts:

- A total net cost of \$2.40 billion for the period 2021 to 2032 and avoided adverse health outcomes worth \$2.44 billion for the same period.
- Unit costs of regulation in 2030 of \$1.30 per Twenty-Foot Equivalent Unit (TEU) for container or reefer vessels, \$5.25 per cruise passenger, \$7.49 per automobile moved on a ro-ro ship, and less than a penny per gallon of finished product for products moved by tanker.
- Net decreases in economic activity over the 2021 to 2032 period due to added regulatory costs and reduced productivity, offset in a few years by new construction activity.
  - By the final year of the projection period (2032), *decreases* of:
    - \$297 million in gross state product;
    - 2,385 jobs;
    - \$234 million in personal income; and
    - \$90 million in private investment.

## Methodology and Assumptions Behind CARB’s Estimate

**Methodology:** CARB’s estimates were based on a multiple-step process:

- Information was developed by CARB staff regarding such factors as costs of permitting, planning, engineering, construction, equipment, installation, and operations, and maintenance.
- These assumptions were then entered into a proprietary economic forecasting and policy analysis model licensed by REMI. The REMI model integrates input-output, computable general equilibrium, econometric, and economic geography methodologies to estimate the impacts of cost changes and other factors on the

broader economy. A basic feature of computable general equilibrium models is that their outputs are highly sensitive to changes in economic assumptions.

**Key assumptions.** The REMI economic model starts with a baseline set of economic assumptions that tie to the California Department of Finance (DOF) forecasts made in the Spring of 2019. At the time, DOF projected that U.S. and California economies would experience moderate but sustained economic growth through 2022, as follows:

- 1) Employment increasing by an average of 1 percent per year,
- 2) Personal income increasing by 4 percent per year, and
- 3) U.S. real gross domestic product increasing by 2 percent per year.

The May 2019 population projection indicated that California would add about 2.4 million people between 2019 and 2032.

Other inputs into CARB’s estimates included diesel price projections and “industry growth factors.” The diesel price projections were based on U.S. Energy Information Administration’s (EIA) October 2018 estimate, which assumed steady growth in diesel prices, from \$2.80 per gallon in 2019 to \$5.03 by 2032. The industry growth factors are intended to capture the impacts of expected growth in port volume over time. They are used by CARB for its baseline emissions estimates and most of its cost estimates. The growth factors are based on a combination of projections supplied by U.S. Federal Highway Administration’s Freight Analysis Framework (FAF) 65 and, where available, from individual ports. Using these estimates, CARB assumes growth factors of 77 percent for container vessels, 79 percent for cruise ships, 52 percent for ro-ro vessels, and 14 percent for tankers.

## Impact of COVID-19 On CARB’s Assumptions

Every key economic assumption in the CARB estimate of the proposed regulation has been dramatically affected by the COVID-19 pandemic. Fuel prices, economic output, jobs, international trade and waterborne port activity will all be sharply lower than anticipated in any economic forecast made prior to March of this year. Given the emerging expectation that recovery from the historic COVID-19-related downturn will be slow (see discussion below), we expect the economic measures will remain below the levels assumed in the CARB projections for several years to come. This will, in turn, have impacts on CARB’s estimates of (1) baseline emissions, (2) emissions reduction and health-related savings resulting from the proposal, (3) costs and savings to the ports, terminals, and vessel operators, and (4) broader economic impacts of the proposed regulation.

49-30

**Recent economic developments.** The COVID-19 pandemic has led to a global economic contraction that is more severe than the 2008-2010 Great Recession. Nationally, new claims for unemployment insurance totaled 26 million over the five weeks ending on April 23. Over the three weeks ending on the same date, California processed about 3.4 million unemployment claims. These claims represent about 17 percent of the U.S. and California

workforces, respectively. Turmoil in global oil markets have driven the price of West Texas Crude downward, to less than \$17 per barrel as of April 23, 2020.<sup>1</sup>

**Department of Finance comments.** On April 10, the California Department of Finance (DOF) sent a budget letter to the Legislature alerting them to the dramatic impact that the COVID-19 pandemic is having on the California economy and state budget. In the letter, DOF indicated that the effects of the downturn will be felt immediately, that the California unemployment rate could peak at a rate higher than the Great Recession of 2008, and that economic softness could persist into 2020-21 and additional years depending on the pace of recovery to local, state, and national economies. It referenced a multi-year recession alternative included in its January budget, and indicated that actual increases in unemployment would be much larger.

**Other recent forecasts.** Recent national economic forecasts show a similarly dark picture for the U.S. economy. On April 23, the Congressional Budget Office released its first post COVID-19 forecast, which showed a 5.6 percent decline in inflation-adjusted gross domestic product in 2020, followed by a subdued increase of 2.8 percent in 2021.<sup>2</sup> (For context, real GDP fell by a cumulative total of 2.6 percent in the first two years of the 2008-2010 recession, which was considered to be the most severe since the 1930s.) CBO's projected level of unemployment is 11.4 percent for 2020 and 10.1 percent in 2021. The primary reason that CBO's forecast anticipates only a modest rebound in 2021 is its expectation that social distancing will continue (albeit at a lesser rate) through the first half of 2021.

Other forecasts show equally sharp declines in 2020, and, under some scenarios, an extended period of subdued economic activity.<sup>3</sup> Factors that could result in long-term declines include permanent downsizing of some sectors and occupations due to such factors as reduced travel, changes in consumer spending patterns, workplace practices (e.g., more home-based workers, more reliance on technology, less travel), and shifts in global supply chains.

## Areas Where A Changing Economic Outlook Will Impact Estimates of the Proposed Regulation

Following are examples of areas where the weaker post COVID economic outlook will affect CARB's outdated estimates of the proposed regulation's impact.

**Less port activity under the baseline.** As noted earlier, the CARB estimates assume substantial growth in vessel visits through 2032. However, trade flows and port activity are

---

<sup>2</sup> "CBO's Current Projections of Output, Employment, and Interest Rates and a Preliminary Look at Federal Deficits for 2020 and 2021." Congressional Budget Office, April 24, 2020. <https://www.cbo.gov/publication/56335>.

<sup>3</sup> See for example, S&P Global Ratings, Economic Research: COVID-19 Deals A Larger, Longer Hit to Global GDP. <https://www.spglobal.com/ratings/en/research/articles/200416-economic-research-covid-19-deals-a-larger-longer-hit-to-global-gdp-11440500>

highly sensitive to changes in the state, national, and global economic environments.<sup>4</sup> Based on current economic realities, vessel activity will grow by considerably less than what was assumed in the SRIA. Beyond the general impacts of an economic recession on port volume, we believe it is possible, potentially likely, that the COVID pandemic will have lasting impacts on growth in cruise ship totals, further reducing port activity in the state.

The reduction in vessel activity will lower the level of baseline emissions, which in turn affects the amount of potential emission reductions and health benefits that can be realized from the regulation.

49-31

On the cost side, the methodology used by CARB scales the great majority of regulatory costs upward and downward in proportion to the size of the projected industry growth factor. Hence, we would expect reduced vessel activity to lower its estimate of regulatory costs. However, we note that not all of the costs associated with the proposed regulation will rise or fall in line with the industry growth factor. We would expect, for example, infrastructure-related costs to the terminals themselves to have both fixed and variable components. Because these fixed costs would be spread over fewer visits, a reduction in activity would *raise* per-vessel regulatory costs.<sup>5</sup>

**Cost shifting.** The SRIA analysis assumes that a significant share of the major costs associated with the land-based shore-power and capture and control systems will be initially be borne primarily by ports. However, the impact on ports is assumed to be lessened by two factors: (1) the major capital costs are annualized over a 20-year life for terminal equipment; and (2) some, perhaps most, of the costs will be shifted – from ports to terminal operators through lease increases, and from terminal operators to vessel owners and owners of discretionary cargo through rate increases. Thus, the ultimate incidence of the proposed regulation is assumed to be shared by entities around the world.

However, a couple of points are worth noting. First, the required infrastructure costs are not revenue-producing. Consequently, it is not possible to finance them through the traditional revenue-bonding mechanisms used by ports. While it may be reasonable to assume that some of the port authorities could handle the major expenses imposed by this proposal without reducing other expenditures during good economic times, the situation is markedly different when the economy is soft, even at the larger ports. Under such circumstances, regulatory costs are more likely to squeeze out other port projects that are potentially productivity-enhancing or emissions-reducing (at a more cost-effective rate).

Second, the impact on ports is magnified by the fact that it is more difficult to shift costs onto vessel owners and owners of discretionary cargo when these entities are facing their own financial hardships in a depressed economy. If a smaller portion of the regulation's

---

<sup>4</sup> As an example, cargo tonnage through the Port of Los Angeles grew by 50 percent between 2002 and 2007, but plunged 17 percent the following year, and did not return to the pre-recession level for a decade. Source: Tonnage Statistics/Port of Los Angeles. <https://www.portoflosangeles.org/business/statistics/tonnage-statistics>

<sup>5</sup> As noted in the on page 26 of SRIA report, "As terminal visit activity decreases, the cost effectiveness of installing emissions control equipment becomes worse, as there are fewer vessels calling at the terminal to use the equipment and to help recoup the costs of installing, operating, and maintaining the equipment."

costs are borne by discretionary cargoes and vessel visits, then a larger portion of those costs will necessarily be borne by Californians. In a growing market, it may be reasonable to assume that the cost-incidence of a proposed regulation will be shared broadly by cargo owners and consumers around the world. However, when markets are less robust, those costs will become more concentrated in this state.

**Fuel-related savings estimate.** CARB's estimate of net costs incurred by vessel operators using port power includes vessel equipment and maintenance costs. But these costs are partly offset by fuel savings, since the vessels would no longer have to run their auxiliary engines when in port. The estimated amount of fuel savings is based on the marine gas-oil price of \$763/metric ton (actual cost in April 2019), adjusted using the U.S. Energy Information Administration's (EIA) price projections for transportation diesel fuel. The EIA projection, made in October 2018, assumed that diesel prices would rise from \$2.80 per gallon in 2018 to \$3.39 in 2020, \$4.30 by 2025 and \$5.03 by 2030. (The same forecast assumed that West Texas crude oil would rise from \$50 per barrel in 2018 to \$72 per barrel by 2020, \$100 per barrel by 2025, and \$120 per barrel by 2030. As noted earlier, the price as of April 24 of this year was \$17 per barrel.) If lower crude-oil prices persist, the avoided costs will be substantially *less* than assumed in the CARB estimate, and net costs of the regulation will be *higher*.

**Competitiveness.** The SRIA indicates that the proposed regulation will increase costs to California ports and the vessels that visit them. It also indicates that it is not possible to determine the impact of the higher costs on cargo diversions. It asserts that studies exploring the relationship between general cost increases and cargo diversion have come to varying conclusions; and in cases where effects were found, they were the result of cost increases that were much larger than those that were estimated to result from the proposed regulation.

We recognize that shipping decisions are based on a variety of factors in addition to costs, including logistical considerations and access-to-markets. However, we also believe that cost considerations become more important when economic conditions deteriorate, and shipping margins become tighter. This may be particularly true for some of the Northern California ports, newly affected by this proposed regulation, that are closer to the port in Tacoma, Washington. For this reason, we believe it would make sense to revisit these potential cost impacts on California port competitiveness in light of the new economic realities.

## Conclusion

The COVID-19 virus has fundamentally altered the economic landscape. The Department of Finance May 2019 economic forecast and the EIA fuel price projections, and other inputs used by CARB to develop the benefits, costs, and economic impacts of the proposed regulation, are no longer credible. For these reasons, CARB's existing SRIA would not accurately inform its Board and members of the public of the true economic impacts of the proposed regulation, and needs to be revised. It makes sense to delay action on the

proposed regulation at least until the economy emerges from the current crisis, and the post-COVID-19 outlook becomes clearer. At that point, CARB should re-estimate the proposal's impacts based on assumptions that more accurately reflect the economy in the post-COVID-19 world.

## Author Biography

**Brad Williams** joined Capitol Matrix Consulting (CMC) in 2011 after serving in various positions in California state government for nearly 33 years. During the past nine years at CMC, Mr. Williams has been involved in hundreds of projects covering energy and regulatory policy, economic forecasting, economic impact analysis, and state and local government taxation and finance. During his prior three decades in state government, Mr. Williams served in key positions in the State Treasurer's office, Assembly Appropriation Committee and the Legislative Analyst's Office, where he was chief economist and Director of Budget Overview and Fiscal Forecasting. During his government career, Mr. Williams was regarded one of the state's top economic and fiscal experts, and he was recognized by the Wall Street Journal as the most accurate forecaster of the California economy in the 1990s.

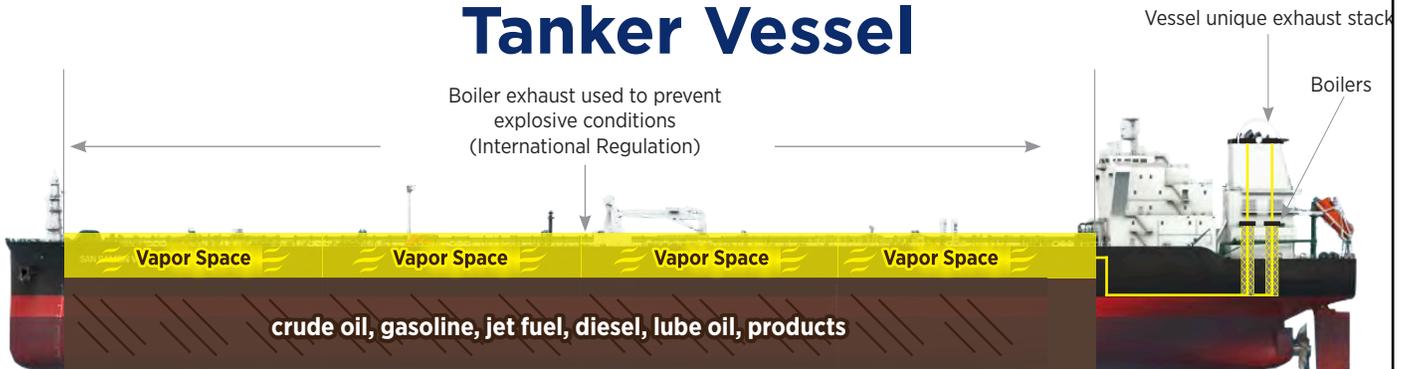

# Stack Capture is not ready for pilot testing on tankers

**A Feasibility Study is needed first to ensure all safety and operational conditions are taken into consideration because:**

- Tankers are different from cargo vessels and have more safety considerations than container vessels

- Stack Capture systems will disrupt tanker boiler systems used to prevent explosive conditions.
- Stack Capture connections need to be vetted by U.S. and international maritime regulators and organizations

## A crude oil tanker exploded – Why is that unusual?

TOM GULDNER ([HTTPS://IFFMAG.MDMPUBLISHING.COM/AUTHOR/TOMGULDNER/](https://iffmag.mdmpublishing.com/author/tomguldner/)) - 10/12/2018

On August 15, 2018 an explosion rocked the VLCC Desh Vaibhav. The vessel had just off-loaded 270,000 mt of crude from the Persian Gulf and her tanks were empty at the time of the explosion. Tragically, several crew members were killed in the incident.

The explosion is reported to have occurred in a forward empty tank. Now, we all know that an empty tank can be more dangerous than a full tank. A full tank usually does not have enough of a vapor space to allow a flammable atmosphere. The empty tank is filled with the vapors from its previous cargo. In this case, the previous cargo was crude oil whose vapors are extremely flammable.

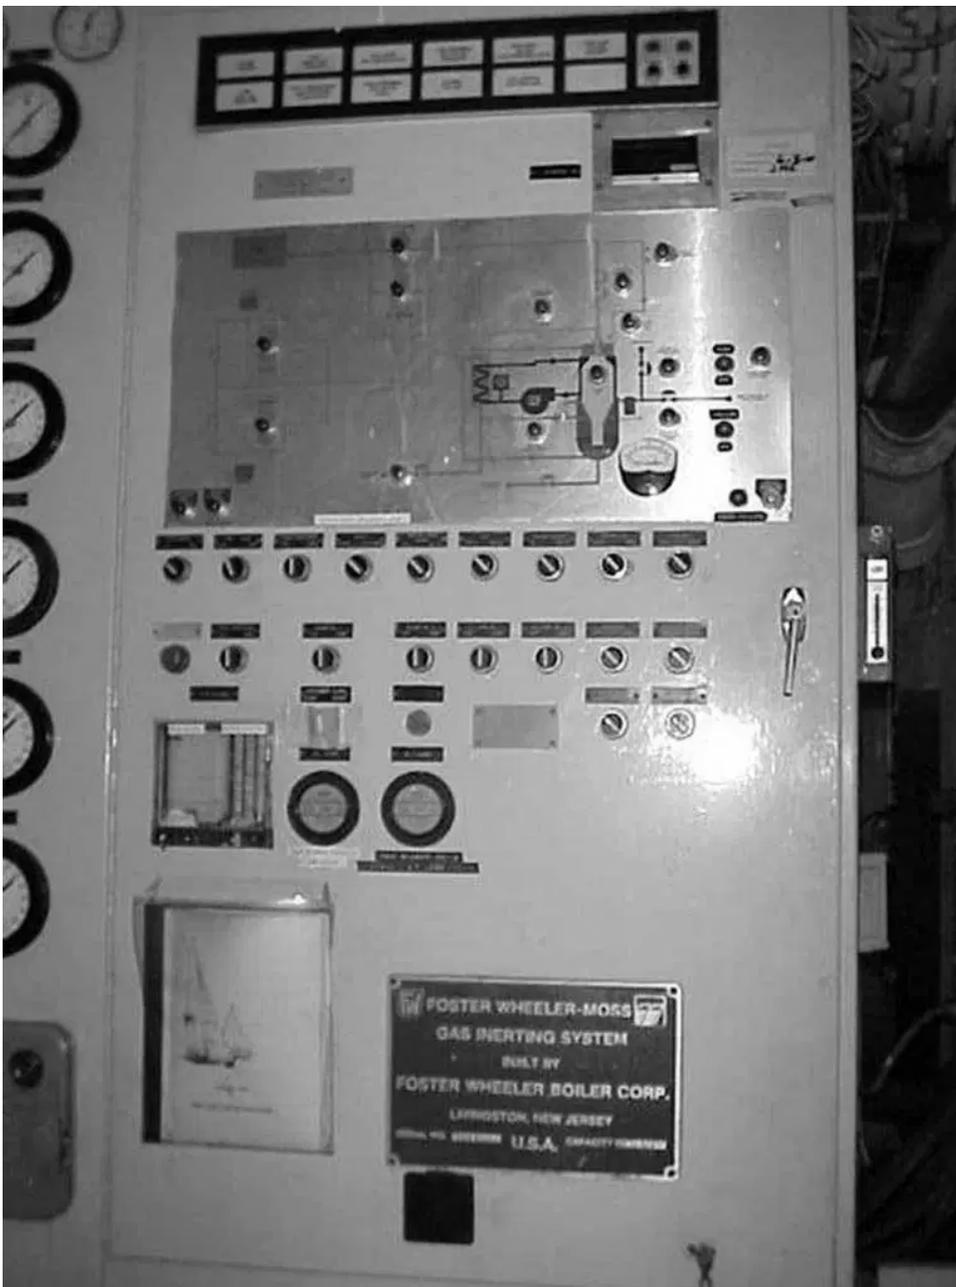

49-32  
cont.

Many experts at the time stated that due to the tanks previous cargo the explosion was not unusual. One would think that this was a logical conclusion. Flammable vapors can explode if they are confined.

So, why do I say that it should it be unusual to hear that this empty crude oil tank exploded? And, why is important that land-base firefighters care about this at all?

First, lets look at the history of the marine transport of crude oil. Many years ago, crude oil tankers were merely single hulled vessels with very few safety features. There were also not many restrictions on the venting of the tanks after unloading. In fact, many times after unloading, the tank covers were just left open to allow the tanks to vent by themselves. These openings were supposed to be covered with a flame screen but that was often either not done or the flame screens were not well maintained, and many contained holes.

If the vapors escaping the venting tanks reached a source of ignition and those vapors were within the flammable range, the vapors would ignite and burn back to the open tank causing a devastating explosion.

Inert Gas Generator.

One such incident occurred on Dec. 17, 1976 in Los Angeles harbor aboard the SS Sansinena, a tanker ship which had just unloaded her cargo of 20 million gallons of crude oil. The cargo tanks were left open to vent the tanks. This venting was legal at the time if there was a sufficient breeze. On this night however, the breeze was very slight and the heavy crude oil vapors wafted along the deck until they found an ignition source. The resulting explosion killed 9 people, broke the ship in two, and blew the deck off the ship and sent it 200 feet inland.

That incident changes some of the rules and even prompted some changes to tanker design. The SS Sansinena had a mid-ships bridge with an officer accommodation area over the product tank. After this explosion no accommodation blocks could be located above the product tanks. Another change will be mentioned below.

So, that's for a tanker at dock. The VLCC Desh Vaibhav was underway when the explosion occurred. Let's go back in history again to look at this issue. Many years ago, numerous crude oil tankers were experiencing explosions mid-ocean while returning home after discharging their cargo. Investigators were looking for any hot work being performed during the explosion which might have led to the ignition of vapors.

In many cases the crews were adamant that there was no hot work being carried out at the time of the explosion. However, the consensus of the investigators and the ship owners at the time was that the crew members were lying about the hot work because the only other operation being carried out at the time of the explosion was the washing of the tanks.

At that time tank cleaning was being carried out with water, under high pressure, ejected from nozzles either permanently mounted in each tank or from portable nozzles which would be brought out and mounted into deck openings. Again, these nozzles were only using water. That could not cause an ignition.....Or could it?

After many of these explosions, which damaged or destroyed the vessels and killed many crew members, the owners wanted a review of the water washing procedures. Engineers were able to duplicate the tank cleaning procedure for study and found that when the water left the end of the nozzle and was traveling to the sides of the tank the stream built up a static electric charge. Just as the water stream was about to touch the side of the tank the electric charge would jump, in the form of a spark, from the stream to the tanks wall. The atmosphere inside of the tank with the crude oil residue was highly flammable and confined in the tank. The explosion was so violent that it often blew holes in the vessels decks and hull plating and in many cases caused the total loss of the ship.

49-32  
cont.

Image purporting to show the blast damage aboard the Vaibhav.

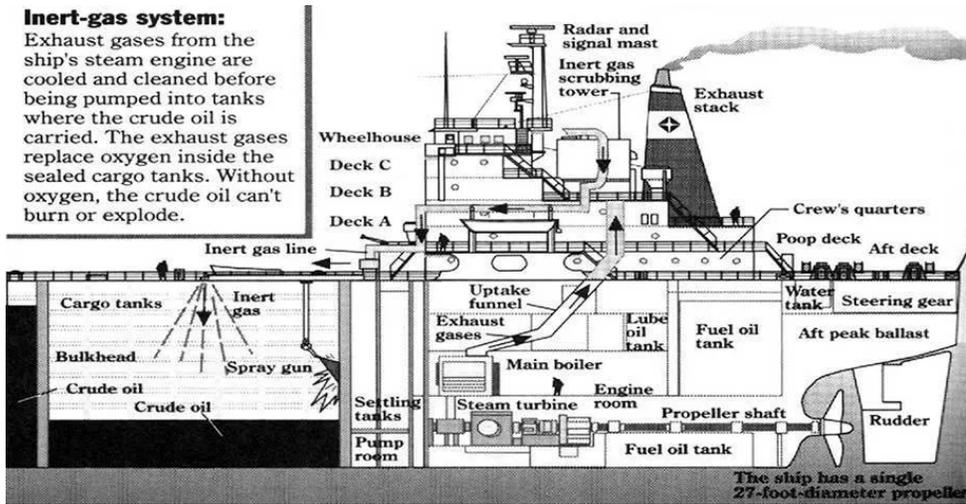

We have just found another issue that need regulations. It was determined that tankers with flammable cargos would need to be fitted with a “gas inerting system”. In 1974 the US Coast Guard formulated regulations requiring Inert Gas Systems (IGS) on all crude oil tankers over 100,000 tons that were built AFTER 1974. This rule did not affect existing ships and only applied to ships operating in US waters. After the SS Sansinena disaster the rule was extended to include all oil tankers over 20,000 tons and operating in US waters. The International reaction took much longer to provide regulatory measures to counter this problem.

In 1982, the International Maritime Organization (IMO) rules required IGS on all new oil tankers above 20,000 deadweight built after May 1982. The IMO rule was amended in May 1985 to include existing tankers.

What exactly is a Gas Inerting System? In a cargo tank containing flammable vapors there will be a vapor area above the cargo which can be flammable if there is or was a flammable cardo in that tank. If we inject another gas, which is inert, and will not support combustion, into that vapor space in enough quantities, there will no longer be a flammable atmosphere.

The International Convention for Safety of Life at Sea (SOLAS) 1974 requires the Inert Gas System be capable of delivering inert gas with an oxygen content in the inert gas main of not more than 5% of volume. By maintaining a positive pressure in the cargo tanks at all times, with an atmosphere not having an oxygen content greater than 8% by volume, the tank atmosphere is rendered non-flammable. For an added safety margin, the figure of 5% is used.

And where do we find this inert gas? One of the most common inert gasses is Nitrogen. Many ships with IGS systems will have nitrogen generators aboard. However, this can be expensive.

Inert Gas System.

But someone in the marine community looked up that his vessels exhaust stack and said, "that's an inert gas being ejected out into the atmosphere. Why don't we use that to inert the tanks and save money! And they did.

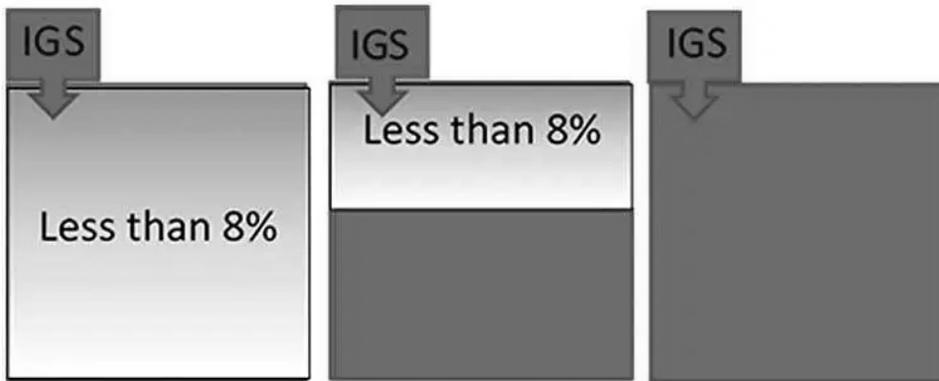

Most IGS systems aboard tankers today are supplied by the vessels own exhaust gas. Of course, the gasses must be cooled and cleaned before you would inject it into a cargo tank. That is why these vessels also have exhaust gas scrubbers. The cleaned exhaust gas is inserted into the vapor area of the cargo tank until the oxygen content of the vapor area is below 5%. At that percentage there can be no combustion.

When the ship is off-loading, the inert gas is continued to fill the empty cargo space and maintain the inert atmosphere. When the tanks are filled the surplus inert gas is vented out of risers on the deck or the vapors are returned to the loading facility.

Some of these vessels will have both the exhaust gas IGS and a Nitrogen generator which would be used as a back-up should the ships engine shut down or be unable to keep the O2 level below 5%

Safety alarms are set to go off if the oxygen level increases and the loading/un-loading operation would be shut down until the condition is corrected.

So, let us get back to my initial question from the start of this article. Why is it unusual that the VLCC Desh Vaibhav exploded? That vessel should have had a required IGS system which, if operating properly, should have made an explosion inside of a cargo tank impossible.

IGS using exhaust gas.

We will have to wait for a full investigation to find the answer but I'm willing to bet that something failed aboard which prevented the IGS system from doing its job.

This is important to land-based Firefighters because the first question I, as a marine firefighter responding to a fire aboard a tanker either loading or unloading would be, "Is the IGS system functioning properly? What is the O<sub>2</sub> level in the tanks?"

If the IGS system is not operating properly then both firefighters and mariners should be aware that the International SOLAS regulations for Inert Gas Systems requires that the system can be augmented from outside sources via required fixed piping for that purpose.

And if you're a mariner, those questions should be even more important. You will be on that vessel while its underway and you will not be able to just evacuate to the dock as I would!

SECRETARIAT D'ETAT AUX TRANSPORTS ET A LA MER  
INSPECTION GÉNÉRALE DES SERVICES DES AFFAIRES MARITIMES  
Bureau enquête — accidents / mer ( BEAmer )

**TECHNICAL  
REPORT OF THE  
INQUIRY INTO THE  
EXPLOSION**

**(one fatality)**

**ON BOARD THE OIL TANKER**

**CHASSIRON**

**ON 13TH JUNE 2003**

**OFF BAYONNE**

**=\*\*=**

49-33

## **1\* CIRCUMSTANCES**

On 12<sup>th</sup> June 2003 the *CHASSIRON* called at Bayonne from Donges to unload the cargo of her 386<sup>th</sup> voyage consisting of 3 parcels distributed as follows :

- **Cargo tanks 1 (P & S) : domestic heating oil**
- **Cargo tanks 2, 3, 4, 5 (P & S) : gas oil**
- **Cargo tanks 6 (P & S) : unleaded mogas (98 octane)**

She left Bayonne for Donges at 0500 on 13<sup>th</sup> June 2003 to take on an identical but differently distributed cargo load.

- **Cargo tanks 1 (P & S) : unleaded mogas (98 octane)**
- **Cargo tanks 2, 3, 4, 5 (P & S) : gas oil**
- **Cargo tanks 6 (P & S) : domestic heating oil.**

After the vessel got under way, the pumpman and the boatswain began tank washing operations on Tank 1 (P & S) and 6 (P & S).

At 0709 they had just begun washing cargo Tanks 6 (P & S), which had previously contained mogas, when there was a very loud whistling sound immediately followed by an explosion and fire in Cargo tank 6. The boatswain who was standing by himself near the cargo manifold, was unhurt. The pumpman who was near Cargo tank 6 port was first reported missing and a search was carried out in the sea, but he was eventually found dead in the after part of Cargo tank 6 port. The deck of the vessel was ripped open from the bridgehouse to the manifold and the bulkheads of Cargo tanks 5 and 6 were severely damaged.

The fire was brought under control at 0800.

49-33  
cont.

Considerable nautical and aeronautical resources were deployed by the CROSS-A to help in the search for the pumpman on the one hand, and to fight the fire on the other hand.

A 6-man assessment team comprising representatives of the Bayonne office of the Bordeaux Ship Safety Centre, and the Bayonne harbourmaster's office as well as the Bayonne pilot and tug services went on board at 1052. After the situation had been assessed, the vessel was granted permission to return to Bayonne where she berthed at 1348.

49-33  
cont.

\*\*\*

## 7\* CONCLUSIONS

Up to now it has not been possible to determine unequivocally the origin of the ignition source which caused the explosion. Nevertheless, two possibilities have been retained :

- a source of mechanical origin due to the malfunction of the cargo pump,
- a source of electrostatic origin which could have been produced by a lack of equipotentiality of the cargo pump or tank washing machine, or (but this is less likely) by deterioration of the coating of the tank surfaces (spots of rust were observed at the bottom of the tank).

The air/unleaded grade 98 mogas ATEX in Tank 6 starboard only needed a few microjoules energy to ignite.

Four sequences were considered :

- **a deflagration detonation transition;**
- **a "bang box" phenomenon (high-pitched whistling sound) followed by a generalized explosion;**
- **the rapid propagation of a deflagration from one tank to another;**
- **an explosion in one tank resulting in combustion phenomena (multiple explosions) in other tanks.**

According to the analysis of the accident, the damage sustained was the result of the domino effect of a series of successive explosions (three in all) in a deflagration regime.

49-33  
cont.

The observations made by the BEAmer investigators and the INERIS specialists favour the hypothesis that the first explosion took place somewhere near the bottom of Tank 6 starboard (in all likelihood near the cargo pump), followed by a second explosion in Tank 6 port caused by the propagation of the heat of the first explosion and a third and final explosion due to the ignition of the gas oil vapour in Tank 5 port.

The noise heard just before the explosion, which was described as a whistling sound, could have been the noise made by turbulent combustion in a small confined space and, as such, would have been the "initial" event characteristic of the explosion. It could also have been due to a rise in pressure inside in the tank, the noise being made by gases escaping through the small inspection hatch just before the explosion, or again, it could have been due to friction between moving parts.

Among the factors which may have helped to trigger the explosion :

- **the operation of the pressure venting valves during unloading, opening the small inspection hatches for tank inspection and tank cleaning, the technique of injecting compressed air to strip the submerged pumps all led to the ingress of air which provided the oxidizer making it possible for an explosive mixture to form;**
- **the unleaded grade 98 mogas carried was of the "summer", less volatile variety; its vapour pressure was therefore lower than that of the "winter" product. This reduction of the vapour pressure brought it closer to the flammable range;**
- **tank washing operations set up turbulence zones within the tanks.**

Bearing in mind the low flash point of the unleaded grade 98 mogas and its temperature (25.2°C) before unloading commenced , it can be affirmed that the weather conditions had no influence on the formation of an air/unleaded grade 98 mogas ATEX during unloading.

49-33  
cont.

Tank cleaning was carried in the usual way. The pumpman was very experienced as regards tank cleaning but human error cannot be excluded. Dropping a tool, for example.

As regards firefighting, the destruction of the fire line on deck and the absence of sectioning valves on the engine-room fire main meant that the firefighting system was not immediately available (it was necessary to wait for the damaged section to be sectioned off by means of a plug). Further sectioning valves should be installed so that the fire main in the engine room remains available for use in the event that other sections of the system become unserviceable.

Finally, as a preventive measure, the use of electrostatically non-insulating paints or coatings for tank surfaces should be preferred

# Industry supports calls for IGS on small tankers

11 Apr 2017 by Riviera Newsletters

A year after 8,000 dwt tanker newbuildings were required to fit inert gas systems, many agree this is an arbitrary limit

**A year after 8,000 dwt tanker newbuildings were required to fit inert gas systems, many agree this is an arbitrary limit**

“How big a blast can you accept?” That was how Rune Damsgaard, business director of the nitrogen-generating system maker Air Product, summed up the debate about the 8,000 dwt threshold for tanker newbuildings to be equipped with fixed inert gas systems. It was adopted by IMO’s Maritime Safety Committee (MSC) at its 93rd meeting in May 2014, came into effect at the start of last year, and applies to tankers of that size and above when carrying certain cargoes.

But ships smaller than that are also at risk of explosion. One such was *Doola No 3*, a 6,500 dwt product tanker that exploded while it was cleaning its tanks after offloading a full cargo of gasoline in January 2012. Only five of its 16 crew survived, and three casualties were never recovered. The Korean Maritime Safety Tribunal report highlighted management and operational errors: the tanks had not been adequately gas-freed, and most of the crew’s clothing “contained polyester fibres, which are highly conducive to static.”

Discussing the incident with *Tanker Shipping & Trade*, Mr Damsgaard suggested that, whatever the cause in that case, when a tank is inerted “it will forgive mistakes”.

Alfa Laval business development manager Rob Fortanier made a similar point, saying that most failures on a tanker are the result of human error or incorrect operation. Although the risk of an explosion is lower on smaller tanks, “human error can never be 100 per cent prevented, so “if safety is first, then you need inert gas on smaller vessels,” he said.

At Coldharbour Marine, which makes the Sea Guardian inert gas system (IGS), commercial manager Phil Hughes echoed that sentiment. “Inerting systems should be fitted to smaller vessels, particularly on newbuildings,” he said.

But Erik Taule, general manager for IGSs at Wärtsilä Moss, provided a reality check. He agreed that “statistics do not lie: size does not dictate explosions.” But “the market does not show any signs of implementing safety systems that are not required under rules and regulations,” he added. In his experience, no customer has asked for an IGS to be included in a quote involving vessels below 8,000 dwt.

Even with the lower tonnage limit, it will be some time before a significant proportion of

**Flashpoint, not size, is what matters**

If a ship's size should not be used to determine whether it needs an inert gas system (IGS), what is the alternative? When IMO debated the changes to Solas in 2007, Intertanko's delegation proposed that its cargo's flashpoint should be the deciding factor.

It is an approach supported by Rune Damsgaard, business director of the nitrogen-generating system maker Air Products. He pointed out to *Tanker Shipping & Trade* that offshore supply vessels, irrespective of their size, already have to have nitrogen systems for carrying low flashpoint liquids. So the principle already exists.

Class notations might be one way of indicating what cargoes a ship could carry, he suggested. Chemical tanker notations already reflect this, based on their tank construction and equipment outfitting, so a similar notation could be devised based on a tanker's inerting system.

By this assessment, for example, a tanker destined for a long-term charter to carry vegetable oil would not need an IGS, whatever its size. It must be carried in a ship classed to carry IMO type 2 chemicals that, depending on its size, will be fitted with an IGS that is never used apart from when it is tested. "The rules should be more in balance with real life," Mr Damsgaard said.

## Tab 13

### List of Inaccurate Staff and Public Statements CARB Hearing on At Berth Rule – Dec. 5, 2019

- p. 5:19-24: “Further emissions reductions from ocean-going vessels at berth are needed to provide public health benefits to the port communities that are already heavily burdened by air pollution from port-related freight sources, as well as to contribute to our ozone and greenhouse gas reduction goals.”
  - The evidence in the record does not support the view that reductions at berth are likely to be any significant contributor to achieving ozone and greenhouse gas reduction goals, or that such reductions will yield any measurable net public health benefit.
  - Also, Staff’s estimate of growth in emissions is inaccurate, as it only relies on the 2016 Mercator report and the Freight Analysis Framework
  
- p. 7:16-22: “But staff has taken this opportunity to really connect with our port communities and work closely with them and the maritime industry in order to develop a regulation that’s really health protective, but also takes into account the unique operations that occur in our ports here in the State.”
  - Also p. 14:4-6: “Now, to develop this proposed regulation, staff has conducted extensive community and industry outreach.”; 13-19 “We’ve also had the opportunity to thoroughly engage with our maritime industry. We’ve gotten the opportunity to visit many of the vessels, ports, and terminals that would be included in this regulation. And again, the tour gave our staff a much better insight to understand the unique layouts and operations of some of these vessels, terminals, and ports.”
  - Staff has largely rejected data from industry showing that the regulations are not likely to reflect the public health benefits staff claim.
  
- p. 13:6-11: “Now, after full implementation of the existing regulation in 2020, there are no additional measures on the books to continue reducing the remaining health benefits -- or sorry, the health burdens that are associated with our ocean-going vessels at berth.”
  - The suggestion that the existing regulation would not continue to reduce health burdens and emissions after 2020 is not true. The existing regulation imposes aggressive diesel engine operational time limits and emission reduction requirements that apply indefinitely, and those limits and reductions have gotten more and more stringent over the past 10 years. Electricity provided to vessels at berth must meet minimum NOx, PM and CO emissions standards. Vessels visiting a terminal equipped to provide compatible shore power must use that power in every visit to that berth. These are measures that will continue to yield health benefits well beyond 2020.
  
- p. 14:21-24: “So through this extensive interaction, staff was able to craft a proposal that we believe is aggressive, yet technically feasible.”
  - Also, p. 26:10-12: “Now, technology manufacturers have assured CARB staff that there are engineering solutions for both ro-ro and tanker vessels.”

- The technology providers may have assured staff that engineering solutions can be developed at some future date, but they have not stated that solutions currently exist or that implementation can be assured within the proposed timeline. As WSPA has discussed with CARB staff on numerous occasions, the evidence demonstrates that implementing the necessary infrastructure at tanker terminals cannot be accomplished feasibly and safely within the rule’s deadlines. Moreover, there is no way to know whether the proposal as currently designed is ultimately feasible without conducting a feasibility study.
  - Moreover, technology providers have not assured staff that feasibility is already demonstrated. *See, e.g.*, Initial Statement of Reasons Appendix C-1 (SRIA), p. 81: “During meetings between staff, tanker industry stakeholders, Tri-Mer and CAEM, Tri-Mer stated that a feasibility study would be needed at each terminal to determine how the technology would be incorporated into the terminal’s operations.”
  
- pp. 25:24-25 to 26:1-6: “So I also mentioned earlier that the proposed regulation also includes an interim evaluation in 2023. So staff have set ambitious implementation timelines for realizing the health benefits of this regulation as early as possible, but we also realize there may be some uncertainty with adapting these technologies for new vessel types and also with the infrastructure developments that may be required.”
  - This is not a matter of mere “uncertainty with adapting these technologies for new vessel types and also with the infrastructure developments that may be required.” CARB staff have not established in the **first** instance that the current state of technology would even allow for tanker adoption at private marine terminals.
  
- p. 26:12-13: “And shore power has actually been used on tanker vessels here in California.”
  - The evidence does not reflect that this has been done at scale anywhere for oil tankers calling on private marine terminals.
  - Other statements in the transcript itself rebut this claim. *See* p. 106 (Port of Long Beach (“POLB”) tanker demonstration is unique), p. 114 (T. Umenhofer response to Board member Gioia), pp. 118-119 (B. McDonald response)
  
- p. 26:16-20: “[S]taff have been able to analyze multiple terminal infrastructure projects really to assess the timelines that are required to complete existing projects. And we feel the timelines that are proposed here are aggressive but feasible.”
  - As industry has communicated to staff, the existing projects staff have looked at do not begin to reflect the massive and complex level of work that would be required at terminals to construct equipment that would even have a chance at meeting this regulation.
  
- pp. 26:21-27:1 – “However, to address the uncertainty of the timelines for these new vessel types, CARB staff propose an interim evaluation in 2023 to assess the progress of adapting technology for new vessel types and also the necessary infrastructure improvement projects that might be going on.”

49-35  
cont.

49-36

49-37

- This proposed interim evaluation, not due until in December 2022, would not “address the uncertainty of the timelines for these new vessel types.” This is not just about “uncertainty of timelines”; this is about whether compliance with the regulation as written is feasible at all for marine terminals hosting oil tankers. The current regulation imposes hard deadlines for tanker compliance, regardless of the results of the interim evaluation. So, terminals will be bound by those deadlines irrespective of the actual feasibility of these measures in that timeframe, and would be completely dependent on CARB choosing to adopt new deadlines, which this regulation would not require it to do.
  - Board member Gioia, on pp. 153-158, expresses concern about long permitting time frames, referencing his own experience.
  
- p. 27:10-18: “And most importantly, as seen here on slide 20, the health benefits of the proposed regulation outweigh the costs. And looking at real costs for the regulation, so in other words those costs that might be passed down to the consumer, we’re looking at the total cost of the proposed regulation are expected to be minimal on a per unit basis, for example, less than one cent for a gallon of fuel.”
  - See also p. 28:9-12: “So the projected NOx reductions of 46 percent and diesel PM reductions of 52 percent at full implementation of the proposal are shown here on slide 22.”
  - See also pp. 28:19-29:1: “Now, as a result of the projected emissions reductions achieved by staff’s proposal, a reduction in potential cancer risk of 55 percent is projected for the ports of Los Angeles, Long Beach, and Richmond. And non-cancer related benefits are also expected in association with staff’s proposal, including 16 avoided emergency room visits, 72 avoided hospital [ad]missions, and 230 avoided premature deaths.”
  - The evidence does not establish that the health benefits would outweigh the costs, as CARB staff consistently overstate the expected health benefit versus the baseline and understate the implementation costs to industry.
  
- p. 28:2-7: “Now, an important highlight on this slide is the \$10 million that CARB has earmarked for a capture and control system for tankers. Now, it’s staff’s intent that a tanker terminal would use these available funds to demonstrate capture and control technology use on tanker vessels here in California.”
  - The fact that CARB has earmarked this \$10 million evidences that capture and control has not been demonstrated on tanker vessels, and belies the claim that stack capture and control has somehow already been shown to be feasible. Capture and control is not ready for field demonstration on tankers, and it would be unsafe to attempt one at this time. Not only is a feasibility study required, but industry would need to first perform engineering to address the unique safety considerations of tankers and the diverse configurations of the worldwide tanker fleet. If the technology shows promise, it can lead to a field demonstration, but only as the final step.
  
- pp. 30:23-31:2, 11-15: “Now, staff is also proposing to develop a process for industry to pursue innovative emissions reductions concepts, if they can be proven to achieve extra

49-37  
cont.

49-38

49-39

or early emissions and exposure reductions in impacted port communities without a delay . . . Now, these concepts would be limited in duration and only acceptable until the infrastructure needed for the regulation is completed. They would not provide an out [from the] At Berth Regulation and the process would include an opportunity for public review.”

- *See also* pp. 49:24-50:5: “BOARD MEMBER TAKVORIAN: So we can't have this temporary solution occurring and all the effort going into that and then the permanent solution fix being worked on afterwards? TRANSPORTATION AND TOXICS DIVISION CHIEF ARIAS: Correct. This is not in lieu of ultimate regulatory compliance.”
  - *See also* p. 174, Takvorian: innovative alternatives shouldn't be a “way out”; and p. 183, Mary Nichols, interim review should not provide “a potential off ramp.”
  - Industry stakeholders clearly stated to CARB staff that alternatives like those discussed would need to be **in lieu of** the proposed reduction requirements for tankers visiting terminals, not in addition to the regulation, or only available for the time needed to build infrastructure.
  - These statements reflect staff's assumption that, even if the emission capture and control technology is not feasible today, it will be in the future, so that alternatives or “innovative concepts” would only be necessary as a “bridge” to the ultimate control technology. But this is only an assumption; no evidence exists today that the currently proposed capture and control systems for tanker terminals would ever be reasonably safe and feasible. The rule needs to provide for permanent alternatives that can still accomplish the same reductions in mass emissions, but feasibly and more cost-effectively than the proposed rule. *See also* WSPA's more detailed comments on the Innovative Concept proposal in our letter on the 15-Day Changes.
- 
- p. 37:5-9: “So we would, at this point, as I think Nicole mentioned and there's a picture in one of the slides is that shore power has been and is in use at a terminal in Long Beach at T121. And so it's -- it is demonstrated to be effective for tankers.”
    - From POLB – T121 Marathon Terminal does have shore power capability that is being used by one tanker vessel, but that vessel is unique because it uses diesel electric engines. The rest of the vessels visiting the Port are not capable of shore power retrofits, as their boilers cannot be electrified. *See* POLB letter to CARB dated December 9, 2019, Comments on the Proposed Regulation Order, “Airborne Toxic Control Measure for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port”, p. 2.
  
  - p. 54:11-16: Sara Rees, South Coast Air Quality Management District staff, stated: “For ro-ro vessels, we are suggesting an earlier compliance date of 2023 instead of 2025 for the ports of Los Angeles and Long Beach. We're requesting this as ro-ro vessels have similar operational power requirements as container vessels and currently approved technologies can be utilized by these vessels.”
    - *See also* p. 26:10-12: “Now, technology manufacturers have assured CARB staff that there are engineering solutions for both ro-ro and tanker vessels.”

49-39  
cont.

49-40

- On the contrary, according to POLB’s December 9, 2019 letter (p. 1): “The implication that RoRo vessels could utilize current emission capture and control technology is not true. The technology for RoRo vessels will need to be engineered to accommodate the greater reach requirements of the RoRo vessels and different stack configurations. A technology capable of scrubbing RoRo emissions has never been demonstrated to date.”

49-40  
cont.

- pp. 78:22-79:14: A resident of Point Richmond stated that “there are sites which can implement these requirements in a significantly shorter time. For example, there the Chevron's Long Wharf dock, which is leased from the State of California. Four hundred vessels a year, sometimes four at a time, dock there, running their auxiliary diesel engines 24 hours a day, and spewing diesel particulates borne by the prevailing wind directly into the City of Richmond. These vessels referred to as lighters by Chevron as -- but as tankers by a layman, are part of a shuffle of perhaps only a dozen different -- distinct vessels. Chevron, which has its own electric power plant and can provide electricity in any quantity, and of any type required to allow these ships to heat the crude oil and pump it up to the refinery without running their diesel engine. Chevron was asked to do this almost five years ago, during refinery modernization but refused to do so.”
  - This statement from a lay member of the public is incorrect.

Chevron’s two existing Cogeneration plants, built in the 1990s, are fully subscribed to support existing refinery operations as the refinery is a net importer of power from PG&E under normal operating conditions. Any incremental power demands as a result of construction or operational activities needed to comply with CARB’s At Berth regulation would require either construction of an additional Cogen to support shore power, or additional purchased power supplied from PG&E to support the capture and control system. This means that Chevron and/or PG&E would have to build electrical infrastructure to support either proposed emission reduction technology.

49-41

The duration of time necessary for this project to be implement at any marine terminal is driven by the following factors: (1) development and testing feasibility of a technology that is safe and suitable for tankers and tanker boilers; (2) design and engineering; (3) completing the CEQA process and obtaining any required permits; (4) procurement of novel equipment developed for this application; and (5) construction in compliance with existing federal, state and local requirements, including species-specific construction windows within San Francisco Bay. To complete the above steps, Chevron has previously provided comments to CARB that the it estimates the above process to take approximately 10 years, and possibly longer, from start to finish. In contrast to the commenter’s statement, it would take Chevron longer to construct the required equipment than most other terminals, because Chevron’s terminal has four operating berths that must remain operational throughout construction to minimize the risk of supply disruptions to the Bay Area.

Chevron Richmond Long Wharf sees upwards of 200 unique vessels calling its Wharf in any given year, not a dozen as mistakenly stated by the commenter,

further complicating the feasibility and timeline for implementing the stack-based capture and control system and shore power.

49-41  
cont.

- pp. 81-89: Staff describes the AMEC system, allegedly an existing feasible capture and control system. This is based on the Coalition for a Safe Environment comments.
  - WSPA understands that the system referenced is a capture and control system for container vessels located at the Port of Long Beach, and has not been designed or tested for tankers.

49-42

- pp. 145-148, in a response to a commenter who misunderstood the summary of CEQA impacts, Chair Nichols stated that the environmental analysis “is not intended to say that there’s any harm that we know of that would come about as a result of implementing this regulation.” CARB counsel stated “[w]e didn’t want to suggest that those changes are going to be really considerable or environmentally harmful” and “we would expect that the local government that approves those infrastructure changes would implement those mitigation measures.”

- The Draft Environmental Analysis (“Draft EA”) discloses numerous environmental impacts that are potentially significant and unavoidable. In addition, as discussed in WSPA’s December 3, 2019 comments and our comments on the 15-Day Changes, the Draft EA understates and fails to adequately address numerous environmental impacts. Even for a regulation intended to benefit air quality, CARB cannot downplay environmental impacts from implementation; disclosing and mitigating such adverse side-effects is the purpose of CEQA review. Moreover, the time needed for local governments to conduct project-level CEQA review that would result in mitigation measure implementation is one of the key reasons that the deadlines are infeasible, as explained in WSPA’s December 3, 2019 comments.

49-43

- pp. 154-159; Board member Gioia is receptive to innovative alternatives whether reductions come from ship or on shore so long as the reductions are additional as required for offsets.
  - *See also* Board members Balmes, Riordan, Mitchell, pp. 165-167, all of whom express interest in obtaining truck emission reductions from alternatives to the proposed regulation.
  - *See also* p. 140 where an environmental justice advocate supports the alternative of truck electrification as a “tremendous opportunity.”
  - If the terminal operators have implemented truck electrification or some other alternative to CARB’s satisfaction, in the period beyond the deadlines while the feasibility of an at berth system is still being explored, there would be no reason to stop and undo the already working alternative and instead implement an at berth control system at a later date. Requiring operators to do so would be arbitrary and capricious double-counting, unnecessary to address emissions already offset by the alternative. *See also* WSPA’s more detailed comments on the Innovative Concept proposal in our letter on the 15-Day Changes.

- p. 168:17-23: “In the course of developing this regulation, staff has done two things. One, in 2018, we did a technology assessment. And part of that technology assessment looked at different technologies, what they were feasible -- what -- how they were feasible, areas that they needed improvement. So that in itself was a portion of the feasibility study.”
  - CARB OGV Technology Assessment looked at the technologies available to date but did not include a formal engineering assessment to evaluate the readiness to control emissions from other vessel types.
  
- p. 169:9-21: “And so in terms of a feasibility study, we feel that between those two documents that we have done a feasibility study. And we have found that these technologies, they exist already, they can be adapted to tankers. We do feel there are safety challenges that are going to have to be addressed during the design. There are going to be site-specific issues that need to be addressed during design and engineering. And so I think our position is that we have done a feasibility study. We need the regulatory certainty now to move into the process, where we're actually looking at design and site-specific engineering projects for these different tanker terminals.”
  - The “two documents” referenced here are the Initial Statement of Reasons (“ISOR”) for the Proposed Regulation and the CARB’s Draft Technology Assessment: Ocean Going Vessels (May 2018). A detailed assessment of both documents and their inadequacies as feasibility studies is attached as Attachment A to this Tab 13, “Review of the ‘Feasibility Study’ for the Proposed At Berth Regulation.
  - Staff has not done a robust feasibility assessment to date. The CARB berth analysis is not a technical document, but simply an aggregation of terminal operator and harbor pilot opinions, and Google Maps review.
  - The berth analysis should have been based on an engineering assessment of the infrastructure required at the terminals. In addition, costs used by CARB in the ISOR are based on conversations with technology developers, rather than real cost quotes.

## Attachment A

### Review of the “Feasibility Study” for the Proposed At Berth Regulation

ARB has concluded that the most likely emission control system for tankers is a shore-based capture and control system (“SBCC”); ES-26 ISOR. At the December 5, 2019 CARB Board hearing, CARB Staff (Bonnie Soriano, video marker 3:38) claimed they have completed a feasibility study for SBCC for tankers at marine terminals. They claim the [2018 Technical Assessment](#) and [ISOR](#) amount to a feasibility study that examines:

1. cost
2. cost-effectiveness
3. market availability
4. ability to scale up
5. safety issues.

This claim was false and misled Board members and the public. Neither document shows how existing capture and control technologies can be adapted to tankers at marine terminals, or that such a technology has been developed. The documents acknowledge the need to re-design and scale up existing technologies because tankers and marine terminal environments are unique, but provides no discussion of how those technologies can be re-designed, omits any discussion of industry’s safety concerns, and defers safety studies. As shown below, the 2018 Technical Assessment and ISOR do not identify existing applications of SBCC for tankers at marine terminals and therefore, CARB cannot claim SBCC is feasible for tankers at marine terminals

49-45

#### I. 2018 CARB Technical Assessment

- A. **Only three pages (out of 147) discuss the state of shore/barge-based emission control systems.**
- B. **The document does not identify any existing SBCCs in a marine terminal and tanker application.** It only identifies two technologies (METS-1 and AMECS) which are barge-based, in use at a port, and only on container vessels. There is no discussion of how adaptable these technologies are to tankers and/or marine terminal environments.

From pages 70-71 of the Technical Assessment:

### Shore- and Barge-Based Emission Control Systems (connected at dockside)

#### 1. Technology Description

Shore-based emission control systems include exhaust gas scrubbing technologies and after-treatment technologies that allow for the capture of auxiliary engine emissions as they exit the stack and treat the exhaust before it is released to the atmosphere. There are also shore side electrical pumps to assist in offloading product from tankers (typically steam turbine pumps are used for offloading). There are currently two barge based systems on the market: the Marine Exhaust Treatment System-1 (METS-1) developed by Clean Air Engineering Maritime, Inc., and the Advanced Marine Emissions Control System (AMECS) developed by Advanced Cleanup Technologies, Inc. These systems are both located at POLA/POLB, and are used by container vessels as an alternative technology to fulfill emission reduction requirements at berth to comply with CARB's At-Berth Regulation.

Figure III-8: AMECS Barge System

The barge based exhaust cleanup systems captures the vessel's exhaust directly from the exhaust stack, using long, flexible ducting to transfer the exhaust smoke back to the barge to be cleaned. Flexible ducting is brought by crane to the vessel's stack. The current systems operate under a strong vacuum to reduce any leakage of air from the

70

NOT shore-based

NOT marine terminals. NOT tanker vessels

Only discussion of shore-based system. Future demonstration is NOT for atanker. NOT for a marine terminal.

Technology is "demonstrated" based on METS-1 and AMECS. Again, NOT shore-based, NOT on tankers, NOT at a marine

exhaust. Once on the barge, the system reheats the exhaust and injects urea so that a selective catalytic reduction system can remove NOx. The system also passes the exhaust through a particulate filter. In addition to engine exhaust, these systems have the potential to also capture and clean boiler exhaust.

Bonnet technology can also be utilized via a land-based system. A shoreside system demonstration is currently planned for use on bulk vessels at POLA beginning in 2018.

#### 2. System/Network Suitability and Operational/Infrastructure Needs

Barge-based exhaust cleanup systems are capable of connecting to a vessel's stacks with a crane mounted ducting system. The barge is towed in place with a tug boat next to a vessel at-berth. These systems have the potential to capture and control the emissions from a range of vessels at berth, and possibly from vessels while anchored. There are times when the barge may be unable to safely connect to a vessel. For example, there may be safety concerns if a crane works a vessel while opposite the barge or if strong winds are occurring. Additionally, the control barge may share the same footprint of a bunker barge, so when vessels are being refueled at-berth, the vessel may be unable to use the barge based control system. Different vessel types may also have different concerns. Providers of barge-based systems are aware of many of these operational concerns, however, and take steps to mitigate them. Taking operational challenges into consideration, a barged based emission control system may be a cost effective option for reducing emissions from vessels that visit infrequently or are unable to connect to shore power, with little to no modification to the vessel.

#### 3. Technology Readiness

To meet the goal of eliminating at-berth ship emissions, continued work on alternative shore power technology is needed to assist vessels and terminals where shore power infrastructure is not feasible or available. Alternative shore power technologies have been demonstrated and are now being deployed. Two systems, the Marine Exhaust Treatment System version 1 (METS-1) and the Advanced Maritime Emission Control System (AMECS) received approval in 2015 for use on container vessels as an alternative to shore power for compliance with CARB's At-Berth Regulation. Clean Air Engineering's METS-1 was developed at POLA as part of a terminal lease obligation. Advanced Cleanup Technologies' AMECS was developed through San Pedro Bay Ports Technology Advancement Program (TAP).

**C. The report agrees with industry that more work (i.e. feasibility study) is needed to demonstrate the technology.**

From page 71 of the Technical Assessment:

6. Next Steps to Demonstrate and Deploy Technology

Although these shore-based and barge-based emission control systems are effective at reducing PM and NOx emissions on container vessels, more testing is needed on other vessel types, including tankers, auto carriers, general cargo, and bulk cargo. Additional work with stakeholders is needed to identify and implement methods (e.g., incentives, regulations, and lease agreements) to encourage or require deployment of additional shore power or alternative shore power systems beyond what's needed to comply with CARB's At-Berth Regulation.

**D. The report acknowledges problems with using SBCCs on tanker boilers**

From page 104 of the Technical Assessment:

Auxiliary boilers are not presently subject to CARB's At-Berth Regulation since they provide steam rather than electrical power. However, they are subject to the low sulfur fuel requirements in both CARB's OGV Clean Fuel Regulation and the federal ECA. These fuel requirements significantly reduce their PM and SOx emissions, and their NOx emissions are already low compared to diesel engines. Additional reductions may also be possible in the future by utilizing new control technologies. One possible control strategy is the use of a barge or land-based bonnet capture and control emissions control technologies discussed in Section III.E. Bonnet capture and control systems are designed to control auxiliary diesel engines, but could potentially also be used to capture and control tanker boiler emissions. Current designs may not be suitable to control the large exhaust volumes from tanker boilers offloading petroleum products, but if the current designs prove to be effective in controlling emissions from smaller emissions sources, it may be possible that they could be scaled up to handle the larger exhaust volumes from tanker boilers.

## II. ISOR

- The ISOR does not show that a SBCC for tankers at marine terminals is available on the market.
- The ISOR does not address how a SBCC can be designed to operate safely for tankers at marine terminals.
- The ISOR discusses the need to scale up existing capture and control, but does not provide an existing example.
- Therefore, the ISOR cannot reasonably estimate cost or cost-effectiveness of SBCC.

**A. CARB omits industry’s safety concerns of land-based systems. CARB does not provide an example of SBCC adapted for tankers.**

From page ES-30 of the ISOR

The infographic for section A consists of two red callout bubbles on the left and a white text box on the right. The top bubble contains the text: "CARB omits industry's safety concerns over land-based systems." The bottom bubble contains: "No working designs for tanker vessels." The text box on the right contains the following text: "For tanker vessels, CARB staff assume the preferred approach to reducing emissions at berth will involve capture and control systems based on conversations with industry members and representatives. Tanker vessel operators have expressed safety concerns with barge systems and indicate the method of capture and control would be land-based, which may require significant infrastructure improvements to the existing tanker terminals across the state. Controlling the auxiliary engines and boilers at berth also mean that the existing capture and control systems will likely need to be able to handle a higher amount of exhaust gas, and as a result may need to be re-designed and scaled up accordingly. Because of the extent of engineering and infrastructure work needed to adapt the existing technologies for use on tanker vessels, CARB staff propose a January 1, 2027, compliance date for tankers visiting regulated terminals at POLA and POLB, and a January 1, 2029 compliance date for the remainder of the tanker terminals across California." A vertical bracket on the right side of the text box is labeled "49-46".

**B. CARB does not provide an example of any capture and control system adapted for marine terminal environments**

From page ES-30 of the ISOR:

The infographic for section B consists of a red callout bubble on the left and a white text box on the right. The callout bubble contains the text: "CARB acknowledges unique environment of marine terminals, but does not explain how existing SBECT can be adapted to operate safely." The text box on the right contains the following text: "During these conversations, CARB staff learned that the process of improving infrastructure at the POLA and POLB was typically faster than in Northern California, due to additional permitting and conservation requirements placed on terminals in the San Francisco Bay.<sup>56</sup> The terminal infrastructure in Northern California may require more complex infrastructure improvements as the Northern California marine oil terminals (also referred to as "long wharves" can stretch out over a mile into the San Francisco Bay and Carquinez Straits, and can be affected by harsher weather conditions and stronger currents than their Southern California counterparts. Figures ES-17 and ES-18 show an example of the two main tanker terminal types in California." A vertical bracket on the right side of the text box is labeled "49-47".

From page I-32 of the ISOR:

The infographic for section B consists of a red callout bubble on the left and a white text box on the right. The callout bubble contains the text: "The two approved capture and control systems are barge-based used at ports. They are not designed or used for tankers at marine terminals." The text box on the right contains the following text: "Thus far, CARB staff has issued Executive Orders formally approving two barge-based system designs (by two manufacturers), consistent with the provisions of the Existing Regulation. Approval required "real world" demonstration of the effectiveness of each system in both capturing and controlling emissions on a number of vessels at berth. The calculated performance of the system must consider the emissions from the small engine on the barge. Each system has continuous emissions monitoring to detect any problems with performance over time." Below this is a second paragraph: "Terminals with wider channels may readily accommodate a barge alongside a vessel at berth, but terminals with narrow channels may not be able to physically fit a barge without blocking navigation in the channel. At many of Northern California's independent marine terminals, there are also potential constraints resulting from the impacts of tidal flows and from prohibitions on impeding the transit of other vessels in designated shipping lanes (between the supports of an adjacent bridge, for example)." A vertical bracket on the right side of the text box is labeled "49-47".

**C. The only SBCC is a prototype not used for tankers at marine terminals, nor is there discussion on how it can be adapted.**

From page I-33 of the ISOR:

This is the ONLY discussion of a land-based system. Still, not used for tankers at marine terminals.

This approach is essentially a land-based version of the barge-based system described above. There is one prototype unit in operation (Figure I-23) that is semi-mobile (the system can be moved along the dock by truck). Once the unit is in place on the dock, the system's articulated arm raises and places the ducting over the vessel stack. The system captures and routes the vessel exhaust emissions from auxiliary engines and boilers to the landside control technology.

**Figure I-23: Land-Based Capture and Control System**

Like the barge-based system, this compliance option would capture emissions from both auxiliary engines and boilers at berth. It reduces emissions of DPM, PM2.5, NOx, ROG, and black carbon. However, it can result in a slight increase in GHG emissions if a combustion engine is used to power the system. Future versions could be zero-emissions on-site, powered by grid electricity, batteries, or fuel cells.

**D. The report does not demonstrate that a SBCC can be designed and operated safely for tankers at marine terminals. Safety studies have not been performed.**

From page III-22 of the ISOR

The report provides for more time to build infrastructure for tankers at marine terminals, but DOES NOT explain how existing technologies can be adapted to tankers in marine terminals.

Safety studies HAVE NOT been performed because a system has not been designed

Staff proposed to split the implementation schedule into two phases for tankers. Tanker terminals at POLA and POLB would phase in first in 2027 due to fewer infrastructure upgrade challenges. The earlier date for POLA and POLB tanker terminals also highlights the pressing need for NOx reductions in the South Coast Air Basin. All other tanker terminals including the Northern California terminals would be scheduled to phase in at 2029. Combining the challenges of installing significant infrastructure and unique permitting requirements placed on terminals in the San Francisco Bay region, a longer timeline is expected for any infrastructure project being undertaken for the Northern California tanker terminals.

Regardless of location, safety studies need to be performed to ensure all safety consideration are met, given that the tanker vessels carry explosive cargos. In addition, comprehensive site-specific engineering and design work needs to be accomplished prior to implementation.

## The Feasibility Study for the 2007 At Berth Regulation

In contrast, before CARB started developing concepts for the 2007 At Berth regulation, it completed a [cold-ironing feasibility study report](#) that identified three categories of information that affirmed the proposed control technology (cold-ironing) was feasible **for vessels at locations** the rule proposed to regulate. These included the third-party technical feasibility studies commissioned by ports and existing/planned applications of cold-ironing (some excerpts shown below). Based on these sources of information, the report can and discusses cost-effectiveness.

For the proposed At Berth regulation, CARB's 2018 Technical Assessment and ISOR do not demonstrate, how SBCC is feasible **for tankers at marine terminals**, but assumes they will be and imposes control requirements and compliance deadlines. Cost and cost-effectiveness discussions are premature because the technology has not been developed for tankers at marine terminals. WSPA has invited CARB to partner and conduct a feasibility study to properly inform the proposed regulation, but it has so far declined.

### Port of Long Beach

In April 2003, the Port of Long Beach commissioned ENVIRON International to conduct a study on the feasibility of connecting ships to electricity rather than running their auxiliary engines while docked at the Port. The study, "Cold Ironing Cost Effectiveness Study," was released in March 2004, and it evaluated

### Port of San Francisco

In October 2004, the Port of San Francisco commissioned ENVIRON to conduct a study on the feasibility of providing shore power at the new passenger ship terminal at Piers 30-32. The new terminal is scheduled for completion in 2008. The feasibility study was required as part of the permit conditions set by the San Francisco Bay Conservation and Development Commission. In this study, four passenger ships that currently visit the Port were evaluated for potential cold-ironing candidates. One of these ships, the Dawn Princess, is already cold-ironed when at port in Juneau, Alaska. The cost estimates used in the report included high- and low-end estimates for ship-side conversions and shore-side

The following are descriptions of cold-ironing installations already operating on the West Coast.

### China Shipping Terminal at Port of Los Angeles

The Port of Los Angeles retrofitted the China Shipping Terminal to include a shore-power infrastructure as part of a lawsuit settlement with the Natural Resources Defense Council (NRDC), the Coalition for Clean Air, and local community groups. The settlement requires a minimum of 70 percent of ship calls to this berth, on an annual average, to utilize shore power. Two ships began connecting to shore power in June 2004. According to the Port's Stipulated Judgment Quarterly Report for the third quarter of 2005, there are now 15 China Shipping vessels that are equipped with shore power. During the first three quarters of 2005, shore power was used for 28 out of 39 ship calls to Berth

### Princess Cruises Ships in Juneau, Alaska

Princess Cruises began cold-ironing its ships berthed at the South Franklin St. dock in Juneau in 2001. The shore power operations were installed in response to community concerns over the smoke emissions from passenger ships visiting in the summer. During the summer cruise season, the air is stagnant over Juneau and the emissions from the ships' auxiliary engines significantly reduce visibility.

According to Princess Cruises, there are currently six ships that are equipped to cold-iron when at port in Juneau. If two of these ships are in port at the same time, only one ship is cold-ironed because the South Franklin Street dock has only one berth. According to Juneau's 2005 Cruise Ship Roster, 38 passenger ships visited Juneau last summer, including all six of Princess's shore-power-equipped ships. One of these ships never berthed at the South Franklin Street dock; however, the five Princess Cruises ships that did cold-iron represented 93 out of 586 total ship visits to Juneau in 2005 (or 16 percent).

### C. Future Cold-Ironing Installations

The following are descriptions of shore power installations planned for ports in California as well as ships that have already been built with cold-ironing capabilities.

#### NYK Atlas at Port of Los Angeles

The Port of Los Angeles is currently building a shore-side infrastructure at berths 212-221 (Yusen Terminal) to provide power to a container ship (NYK Atlas) when in port. The NYK Atlas was equipped with shore-power capabilities when built. The ship first arrived at the Port in August 2004 and made a total of five visits that year. The NYK Atlas is one of 36 NYK ships that visited the Port in 2004, with the other 35 vessels making a total of 107 ship visits. Shore-side construction for this installation is expected to be completed by early 2006. At this site, 6.6 kV will be provided at a plug on the wharf (a "wharf box"). Two cables that are housed on a cable reel on the Atlas will be lowered down the side of the ship via a roller guide and connected to the wharf box. Because the Atlas uses 6.6 kV, no transformer will be needed for this cold-ironing application.

#### Other Sites Planned at the Port of Los Angeles

The Port has indicated that all new shore-side power infrastructures for container ships will include a 6.6 kV plug at the wharf. Transformers, connection cables, cable reels, and plugs will be expected to be included on the ships, not at the wharf. However, the Port is considering an innovative approach of housing a portable power-transfer system, which includes a transformer, cables, and cable

## Tab 14

### Response to Coalition for Safe Environment Presentation

#### Slide 3

“Electric Shore power and SECT Technologies are Feasible”

- There are no certified, approved, or tested shore power connections or Ship Emissions Control Technologies (SECT) for tankers at tanker terminals.
- There is no standard electrical connection for tankers at this time. Any connection will need to meet strict standards to allow connection during hazardous cargo transfer operations.
- No SECT system has been tested or proven to connect to a large tanker boiler.
- These technologies have been shown to work on dry non-hazardous bulk cargo vessels, but development of safe interfaces capable of servicing tankers during hazardous cargo operations will require significant research, development, and testing.

“Electric shorepower and SECT Technologies are proven technologies”

- SECT has been proven for a specific vessel type, however there are several challenges to ensure that this technology can be safely implemented on tankers during hazardous cargo transfer.
- A standard shorepower interface must be developed to allow a safe connection at terminals that conduct hazardous cargo transfer. This connection must be retrofitted to tankers which are not currently required to have shorepower connections.
- SECT systems proven for other vessels are undersized and do not have adequate safety system interfaces to ensure safe connection to tanker boilers that are essential equipment for hazardous cargo transfer and storage.

49-49

#### Slide 4

“All Ports & Shipping Companies can use SECT until their electrical infrastructure is built”

- Current SECT systems are significantly undersized for tanker boilers.
- Current SECT systems are barge based and are not allowed alongside during hazardous cargo operations to ensure tankers can clear a berth during emergencies.

#### Slide 5

~ Use existing state-of-the art off-the-shelf proven technologies

- These technologies are not adequate in size and are not designed for hazardous cargo environments.

~ Do Not require any modification of a ship

- It is highly likely that modifications to tankers would be required to ensure a safe and reliable interface between tankers and SECT systems. The extent of such required modifications is unknown since no system has been designed for tankers.

~ Do Not require any modification of terminal infrastructure

- It has been accepted that barge based systems alongside tankers are not feasible.
- It is anticipated that most if not all terminal berths would be unable to accept structural loading from mobile systems and mobile cranes, so permanent infrastructure would be required. In addition, portable or mobile equipment must be rated for use in hazardous electric area classifications.

49-50

~ Do Not require any additional special permits

- Constructing a shore side SECT system will require major construction and permitting that will take on the order of a decade to complete.
- California Environmental Quality Act (CEQA) mandates that any project requiring discretionary approvals must be evaluated for environmental impacts, including impacts to marine resources, visual and aesthetic impacts, and safety.

49-51

- Some examples of permitting agencies with jurisdiction over marine terminals include California State Lands Commission, the US Army Corps of Engineers, California Department of Fish and Wildlife, US Fish and Wildlife Service/National Marine Fisheries Service, San Francisco Bay Coastal Development Commission and the Regional Water Quality Control Board each of which requires a discretionary approval that may be deemed “special” or supplemental to normal terminal operations.

49-51

~ Can be built Stationary On-Dock or Mobile On-Barge

- As documented, barge based systems are not feasible alongside tankers
- Constructing a shore side SECT system will require major construction and permitting that will take on the order of a decade to complete.
- New dock space will need to be constructed to support the scrubber systems and cranes at most marine oil terminals. This will create cumulative and substantial impacts to the marine environment for the scope of this regulation.

49-52

~ Work on any category class of ship

- No system has been tested on large marine boilers associated with tanker vessels.
- No similar shore system that works with tankers has been proven to work with the wide variety of tankers and tanker boilers that will call on California oil terminals.
- Tankers require significant safety considerations due to the transfer of hazardous cargo
- No SECT barge-based or shore-side system has been designed to reach to the stack of a tanker-sized vessel.
- CARB has not evaluated the safety risk of deploying a SECT system on a tanker and its potential to cause boiler overpressure and risk of vessel fire or explosion. This technology has not been proven or demonstrated to safely “work” on tanker vessels.
- Vendor AEG expressed concern regarding the variety of tanker ship spark arrestors on their stacks and SECT’s current inability to accommodate those spark arrestor designs with existing technology. AEG stated vessel-specific coupling devices would need to be created for each individual ship, spark arrestor and stack diameter. CARB’s rulemaking baseline of 2016 indicated over 1,600 tanker vessel visits to California, with many visiting no more than one time per year.

49-53

~ Capture & Treat Emissions from both Auxiliary Engines & Boilers

- No system has been tested on large tanker boilers.
- SECT builders expressed concerns about their system working at low flow rates and during dynamic changes in flow as cargo transfer rates change.
- SECT vendors have stated in stakeholder meetings with CARB in 2019 that the SECT technology is not ready for tankers and has not been tested.

**Slide 6**

AMECS has undergone risk evaluations by both the American Bureau of Shipping (ABS) and Det Norske Veritas (DNV)

- These risk evaluations did not include hazard review of interfacing with large marine boilers and their unique operational characteristics.
- Most significantly, in spite of these evaluations these systems are still not built to any recognized standard or certification.

Sacramento, CA 95814

## **Re: Delay At-Berth Regulations – California’s Economic Recession**

Chair Nichols:

On behalf of the International Longshore and Warehouse Union (ILWU), I am writing to request a postponement in the development of the pending At-Berth regulatory package. The California Air Resources Board’s (CARB) Initial Statement of Reasons supporting At-Berth regulations made a number of predictions that are no longer likely because of the COVID-19 pandemic. The ILWU supports improving air quality in the communities where we work and live. However, the current health crisis and resulting economic recession have caused a decrease in work for port workers. The proposed regulations would impose financial burdens on terminal operators and ports that would result in additional job loss. Given the current crisis, and for the reasons detailed below, the proposed At-Berth regulations should be postponed until January 2021 and, at that time, CARB should conduct a new economic analysis on the proposed regulations.

### **California’s Economic Recession – COVID-19 Pandemic**

CARB released its Initial Statement of Reasons on October 15, 2019 when California’s unemployment rate was at a record low (below 4 percent). In December 2019, the State of California added 12,600 non-farming jobs. However, in March 2020, California’s economy came to a halt as the State of California and local governments issued Stay at Home Orders in response to the COVID-19 outbreak. Then, California’s unemployment rate jumped to 5.3 percent and 99,500 non-farming payroll jobs were lost. This is the State’s largest unemployment rate increase on record since 1976. In the last week of March 2020, more than one million Californians filed for unemployment. The number of individuals on unemployment increased in April 2020, many private businesses have permanently closed, and local governments are facing major fiscal deficits.

CARB’s Initial Statement of Reasons for the At-Berth regulations stated, “Staff anticipates an increase in cargo shipping activity in upcoming years...”, and highlighted a report published by Mercator International in 2016 estimating “that cargo activity in the United States will grow 50 percent between 2021 and 2032, as measured in TEUs, with activity at the POLA and POLB projected to grow by 57 percent.”

However, from January 2020 to April 2020, cargo volumes have continued to decrease at California’s ports because of the COVID-19 pandemic. Specifically, ports in California have experienced the following declines:

- The Port of Oakland experienced a 7.4 percent decrease in cargo volume in March 2020 compared to March 2019;
- The Port of Long Beach experienced a 6.4 percent decrease in cargo volume in March 2020 compared to the March 2019; and
- The Port of Los Angeles experienced a 30.9 percent decrease in cargo volume in March 2020 compared to March 2019.

Clearly, a new economic analysis is needed as CARB cannot rely on pre-COVID-19 forecasts.

### **Roll on, Roll off Vessels and Job Losses**

CARB's Initial Statement of Reasons asserts that the regulations "provide job opportunities for emission control equipment manufacturers and installers, as well as engineering and construction companies." However, in addition to not accounting for the COVID-19 health crisis, the Initial Statement of Reasons fails to consider the number of jobs that will be lost as roll on, roll off Vessels go to other ports that do not impose At-Berth regulations. Roll on, roll off vessels can and will take vehicles to ports outside of California, which will eliminate port workers jobs. CARB ignores this economic impact.

52-1

Small ports in California generate a large portion of their revenue from the importation of vehicles from overseas manufacturers. In the last two months, these ports have seen a substantial decrease in vehicle imports as California's car dealers' inventory is overstocked and consumers are not making vehicle purchases. The United States is expected to see a 26.6 percent decrease in domestic vehicle sales, which is the lowest volume since 2010. Further, global light-duty vehicle production is expected to drop 21.1 percent due to the COVID-19 virus pandemic this year.

According to CARB's Initial Statement of Reasons for roll on, roll off vessels, "to utilize shore power, every vessel in a fleet would have to be retrofit for shore power to maintain maximum flexibility. Shore power installations would also require significant electrical infrastructure upgrades. Most roll on, roll off terminals resemble parking lots and do not have a large amount of existing electrical equipment." Small ports do not have the economic resources to make such large investment during the current economic crisis. Many of the fiscal assumptions that were used for the initial rule-making need to be revisited and revised based on updated economic analysis and changed conditions across industries due to the COVID-19 pandemic. The At-Berth regulations, at this time, would place a substantial fiscal burden on small ports that are seeing a substantial decrease in the movement of the commodities, such as automobiles, that make them viable.

### **Port Liability**

Ports and port workers contribute to make California one of the top economies in the world. Under the proposed regulations, beginning in 2021, ports and terminal operators will be required to submit plans regarding how terminals will comply with the requirements for ocean-going vessels visiting each berth. However, complying with these requirements for many ports is unattainable as ports do not have billions of dollars to build the infrastructure, especially during an economic

Mary D. Nichols

May 1, 2020

Page 3

recession. The regulations propose burdensome requirements and penalties on ports which will deter cargo from coming to the State of California because ports and terminal operators will not be able to comply as current economic resources are limited.

52-2

Jobs at ports are middle class jobs that cannot be replaced. These jobs are a key ingredient to the economic wellbeing of the surrounding communities. CARB must take into consideration that the proposed regulations will result in job loss, which will have a devastating impact on families that have worked for generations at the ports and need these jobs now more than ever.

The ILWU looks forward to working with CARB to improve air quality in our communities in harmony with the maintenance and creation of jobs.

Sincerely,

William E. Adams

## **Re: Delay At-Berth Regulations – California’s Economic Recession**

Chair Nichols:

On behalf of the International Longshore and Warehouse Union (ILWU), I am writing to request a postponement in the development of the pending At-Berth regulatory package. The California Air Resources Board’s (CARB) Initial Statement of Reasons supporting At-Berth regulations made a number of predictions that are no longer likely because of the COVID-19 pandemic. The ILWU supports improving air quality in the communities where we work and live. However, the current health crisis and resulting economic recession have caused a decrease in work for port workers. The proposed regulations would impose financial burdens on terminal operators and ports that would result in additional job loss. Given the current crisis, and for the reasons detailed below, the proposed At-Berth regulations should be postponed until January 2021 and, at that time, CARB should conduct a new economic analysis on the proposed regulations.

### **California’s Economic Recession – COVID-19 Pandemic**

CARB released its Initial Statement of Reasons on October 15, 2019 when California’s unemployment rate was at a record low (below 4 percent). In December 2019, the State of California added 12,600 non-farming jobs. However, in March 2020, California’s economy came to a halt as the State of California and local governments issued Stay at Home Orders in response to the COVID-19 outbreak. Then, California’s unemployment rate jumped to 5.3 percent and 99,500 non-farming payroll jobs were lost. This is the State’s largest unemployment rate increase on record since 1976. In the last week of March 2020, more than one million Californians filed for unemployment. The number of individuals on unemployment increased in April 2020, many private businesses have permanently closed, and local governments are facing major fiscal deficits.

CARB’s Initial Statement of Reasons for the At-Berth regulations stated, “Staff anticipates an increase in cargo shipping activity in upcoming years...”, and highlighted a report published by Mercator International in 2016 estimating “that cargo activity in the United States will grow 50 percent between 2021 and 2032, as measured in TEUs, with activity at the POLA and POLB projected to grow by 57 percent.”

However, from January 2020 to April 2020, cargo volumes have continued to decrease at California’s ports because of the COVID-19 pandemic. Specifically, ports in California have experienced the following declines:

- The Port of Oakland experienced a 7.4 percent decrease in cargo volume in March 2020 compared to March 2019;
- The Port of Long Beach experienced a 6.4 percent decrease in cargo volume in March 2020 compared to the March 2019; and
- The Port of Los Angeles experienced a 30.9 percent decrease in cargo volume in March 2020 compared to March 2019.

Clearly, a new economic analysis is needed as CARB cannot rely on pre-COVID-19 forecasts.

### **Roll on, Roll off Vessels and Job Losses**

CARB's Initial Statement of Reasons asserts that the regulations "provide job opportunities for emission control equipment manufacturers and installers, as well as engineering and construction companies." However, in addition to not accounting for the COVID-19 health crisis, the Initial Statement of Reasons fails to consider the number of jobs that will be lost as roll on, roll off Vessels go to other ports that do not impose At-Berth regulations. Roll on, roll off vessels can and will take vehicles to ports outside of California, which will eliminate port workers jobs. CARB ignores this economic impact.

53-1

Small ports in California generate a large portion of their revenue from the importation of vehicles from overseas manufacturers. In the last two months, these ports have seen a substantial decrease in vehicle imports as California's car dealers' inventory is overstocked and consumers are not making vehicle purchases. The United States is expected to see a 26.6 percent decrease in domestic vehicle sales, which is the lowest volume since 2010. Further, global light-duty vehicle production is expected to drop 21.1 percent due to the COVID-19 virus pandemic this year.

According to CARB's Initial Statement of Reasons for roll on, roll off vessels, "to utilize shore power, every vessel in a fleet would have to be retrofit for shore power to maintain maximum flexibility. Shore power installations would also require significant electrical infrastructure upgrades. Most roll on, roll off terminals resemble parking lots and do not have a large amount of existing electrical equipment." Small ports do not have the economic resources to make such large investment during the current economic crisis. Many of the fiscal assumptions that were used for the initial rule-making need to be revisited and revised based on updated economic analysis and changed conditions across industries due to the COVID-19 pandemic. The At-Berth regulations, at this time, would place a substantial fiscal burden on small ports that are seeing a substantial decrease in the movement of the commodities, such as automobiles, that make them viable.

### **Port Liability**

Ports and port workers contribute to make California one of the top economies in the world. Under the proposed regulations, beginning in 2021, ports and terminal operators will be required to submit plans regarding how terminals will comply with the requirements for ocean-going vessels visiting each berth. However, complying with these requirements for many ports is unattainable as ports do not have billions of dollars to build the infrastructure, especially during an economic

Heather Arias  
California Air Resources Board  
1001 I Street  
Sacramento, California 95812

Submitted Electronically

Comments on CARB Proposed At-Berth Regulation

Dear Ms. Arias:

On behalf of the Port of Hueneme (Port) we are submitting this comment letter on the 15 Day version of the At Berth Regulation Draft. We appreciate the opportunity to comment on this draft regulation and encourage the California Air Resources Board (CARB) to consider delaying the implementation of these proposed changes as the hypothetical growth in future emissions is no longer possible given the current global economic depression and to provide more time to analyze how the economic fallout from the COVID-19 pandemic affects the California ports. The Port is in full support of statewide emissions reductions and has implemented a comprehensive clean air plan since 2013 which includes a \$15 million shorepower system which has helped reduce the emission of diesel particulate matter from Port vessels by more than 80% since 2008! The Port has installed the only reference grade air quality monitors in the adjacent community, and is building infrastructure on Port, partially funded by CARB, to power a new generation of zero emission cargo handling equipment as part of its pursuit of decarbonized, zero emission operations. The Port has worked to coordinate with CARB staff on the development of these new proposed regulations as Hueneme and our compliance characteristics and business model is unique amongst California ports.

#### Corona Virus Pandemic

In light of the historic upheaval caused by the global COVID-19 pandemic, we respectfully ask for CARB to consider the severity of the economic situation that is developing, and its effects on California's citizens and their ability to do basic things like pay rent and put food on their family's table. With record national unemployment and the wheels of trade grinding to a stop, an unprecedented downturn is beginning which will reverberate through our economy for many years to come. California's ports and their cargo movement partners are scrambling to stave off this downturn while working hard, day and night, on the critical jobs of moving essential goods like fresh foods and medical equipment.

At the present time, it is impossible for us to forecast the full impacts associated with this global pandemic; however, based on the current status of unemployment filings within the U.S. (more than 30 million in 6 weeks), the level of small business stimulus already exhausted at the National level (more than \$500 billion), it is clear that the US economy whose circulatory system is goods movement is in the early stages of a massive economic depression. Initial estimates based on the current data available are estimating that this downturn will be the most severe since the great depression of nearly 100 years ago.

PORT MANAGEMENT

Kristin Decas CEO & Port Director

Foreign Trade Zone #205

WORLD TRADE CENTER®  
OXNARD

CARB has long argued that the expansion of the current At Berth rule is required due to the growth in emissions over the next decade from unregulated vessel calls. CARB forecasted that significant emissions increases will result from growth in vessel calls to the California ports that are not subject to the current At Berth rule. However, the COVID pandemic and economic downturn is already significantly curtailing ship calls to the ports of California including the Port of Hueneme. This downturn is expected to continue for several years, especially at the Port of Hueneme due to our specialized cargo. Due to this reduction in forecasted ship visits, the increase of emissions which this new rule seeks to curtail will likely not be occurring.

#### Hueneme Specific Situation:

While ports statewide will see reductions of vessel calls and subsequent loss of operating revenue, of greatest concern locally is the Port of Hueneme and its impacts. The Port generates over 15,834 jobs in our local economy, and provides 2,536 direct jobs to our immediate community. The Port is a legacy industry serving as a vital economic pipeline for over five generations of Californians and the 4<sup>th</sup> largest employer in Ventura County.

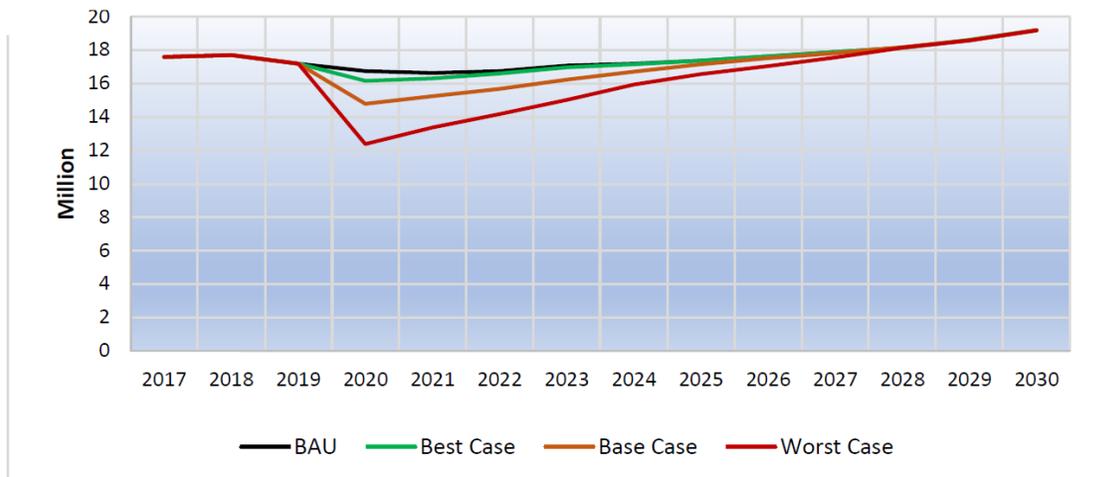

Not only is the Port critical to the region's economy, produce growers throughout California's central valley and coast also rely on the Port to export their produce to Central and South America. The Port's imported produce and goods are distributed to 15 states across America. The auto cargo moving through the Port generates nearly 60% of the Port's annual revenue. Facts about Hueneme and Auto related trade:

- 85% of our imported value annually is cars
- 33% of our imported tonnage annually is cars
- 40% of our exported value annually is cars
- 17% of our exported tonnage annually is cars

Forecasts for the global auto industry predict as much as a 20% decrease in sales from 2019 in 2020. In addition, 6 of the Port's top 10 partners by value of trade have shut down automotive production due to COVID-19 prevention. Also, 60% of our trading partners by value (cars) have shut down their automotive production plants to prevent virus spread. This link shows the numbers and countries the Port does business with. <https://www.ustradenumbers.com/port/port-hueneme-calif/>

The figure below shows the estimated impact to the auto sales industry in the US under three different impact severity scenarios. What is evident from this graph is under the different scenarios, recovery is several years out. Most of the economic models being analyzed presently are presuming that the impacts will be greater than those even estimated in late March or even early April, and that the worst case scenario of those early guesses is much more likely than the preliminary rosier guesses. This means for the Port, auto business may not return to pre-COVID numbers until 2025 or later. This means that the number of vessel calls from RORO ships will be suppressed for the next five years or longer.

**Figure 4.1 US Automotive Sales Volume Forecast Under 3 Scenarios 2017-2030 (units)**

Source: Automotive from Ultima Media

Therefore, the Port encourages CARB to delay implementing this new rule change until a clearer understanding develops of the economic condition of the State as the pandemic matures. This rule will require ports and terminals to invest hundreds of millions of dollars in new infrastructure, which these entities will have to pay for by raising their costs for their cargo customers. For the Port this means funding new infrastructure that will likely cost approximately \$10 million at a time when its revenues have decreased by more than 50% because of the COVID depression. This situation is going to be putting a huge economic handicap on the California ports (and by result the entire State economy) and thus a significant competitive disadvantage just as the economy is trying to recover post-COVID. Raising the cost of doing business in California and making it less competitive at the time when all ports nationwide will be scrambling to get business is the opposite of how to help the California economy and families recover from this economic devastation. When the Country is facing record levels of unemployment and family food insecurity, keeping people employed and growing opportunities for employment should be our focus. Jeopardizing the ability of California ports to keep business and create commerce connectivity that grows jobs is a poor path forward for the State in this current situation.

#### Ongoing Shorepower Challenges

The Port would also like to update CARB on the ongoing challenges of operating a heavily utilized shorepower system. The Port has been endeavoring since the installation in 2014 of its shorepower system to make it available to its customers for all required calls. Maintaining a fully functional array of shorepower vaults to facilitate customer compliance and enable the incredible emissions reductions made possible by the current regulations has been a top priority for Port staff. Nearly six years after the implementation of this regulation, the ports around the State continue to struggle to meet the requirements of this regulation in its current form. The lead times in acquiring parts, availability of qualified vendors to conduct repairs or maintenance all continue to be challenges which can lead to unavailability of shorepower vaults sometimes for weeks on end. For example, the Port just three weeks ago had the

annual preventative maintenance completed on its six vaults by the qualified electrical contractor. Less than two weeks later several of the vaults were plagued by outages with faults in additional parts. These systems are complicated, expensive and dangerous to operate. However, that being said, the Port is fully committed to continuing the operation of these systems.

In closing, the Port is committed to cleaner air for our local community. Many of us, including my family, live in the community surrounding the Port. Our Port community wants to be a part of the solution. For us to continue reducing emissions for mobile sources like RoRo vessels, we need accurate data and resources to thoughtfully develop a solution that can be implemented effectively. As we know, timing is everything, and in the midst of a global pandemic and economic recession, a 6 month pause in this rule making process will enable science and data to determine the best solution for these circumstances.

For us to succeed in this joint effort of a cleaner environment for existing and future generations, we need all hands on deck. We look forward to being a part of the solution, and respectfully ask for your consideration of this request.

Sincerely,

*Giles Pettifor*

Giles Pettifor,  
Environmental Manager

We write today to provide comment on the proposed rewrite of the Control Measure for Ocean-Going Vessels At Berth regulation. This letter presents the Port of Hueneme's (Port) updated comments on status of California Air Resources Board's (CARB) new proposed At Berth Regulations. In light of our extensive comments which are reproduced below unchanged from our 2017 and 2019 comments, we will update CARB with briefer commentary herein which is largely based upon the information and discussion conducted at the recent CARB Board meeting on December 5, 2019.

- The Port would first like to state unequivocally that it is in full support of regulating the emissions from Ocean Going Vessels (OGV) and has partnered with CARB and our local air district to achieve substantial emission reduction progress since the implementation of the first At Berth regulation. Thanks to the combination of the clean fuel rules and the current At Berth regulation **the Port has seen as greater than 84% reduction in the emission of diesel particulate matter from OGV at berth in the Port since 2008.**
- The Port believes that this rule rewrite has the potential to achieve further emissions reductions from OGV, however in order to ensure that the Port can continue its role as the engine which drives substantial regional economic activity, enabling employment of more than 15,000 people, these proposed revisions must be conducted in a manner which pursue the most cost effective reductions in emissions. For the Port, CARB is seeking to apply requirements for further emissions reductions which would be nearly completely reliant upon a technology that is not currently commercially available and is not yet approved for use by CARB. This alternative control system (ACT) will likely be a system which captures emissions from OGV and physically or chemically removes the pollutants from the exhaust gases. These systems are large, heavy, and technically complicated in their design and operation. The implementation of one of these systems at the Port will take substantial resources and time. **This is not to imply that the Port is in opposition to the use of an ACT system for emissions reductions in any way!** However as a steward of public funds the Port does not take lightly the responsibility of investing in a yet unproven technology which may have a cost equivalent to a third of its annual revenue.
- The CARB Board seemed during the December 5<sup>th</sup> meeting to favor moving the date of compliance for requiring an ACT for Roll On Roll Off (RORO) vessels from 2025 to 2023. At the present time the Port presumes that the State of California will require that the ACT system operate as a zero emission system which will require it to be powered by electrical power. Current barge based emissions capture systems use diesel fuel and produce significant emissions through the use of heavy machinery and generators to power the emissions filter process. Presently the Port is nearly at the maximum of its available electrical power ceiling as it seeks to continue the implementation of zero emission technologies on Port. Adding additional power load to the Port will require additional power supply from its utility provider Southern California Edison (SCE). SCE has notified the Port that the regional circuitry upgrades needed to supply the Port with additional power will be of such scale as to take three to five years to complete and cost \$30-50 million dollars. This utility upgrade would preclude the Port from being able to operate a zero emissions ACT by 2023.
- As noted, the annual revenue of the Port is approximately \$16-18 million dollars annually. It is estimated that additional shoreside power capacity at the Port would cost approximately \$20 million dollars. An ACT system for the Port is estimated to cost \$5-7 million dollars.

Additionally, the Port has only six major customers which move cargo through the Port enabling those 15,000 jobs. As noted in previous comment letters, some of the communities surrounding the Port are State designated disadvantaged communities and the Port takes seriously its role of providing the types of jobs which can enable individuals to reach ladders of opportunity. Port related jobs can bring families out of poverty and are increasingly uncommon in the state of growing economic disparity in Ventura County and the State in general. The loss of a single customer would have major economic implications to the surrounding region as each direct Port job has a multiplier creating an additional five to six jobs in the community.

- During the meeting on the 5<sup>th</sup>, many in the audience and the Commissioners stated that it would be “large multinational corporations” who would be forced to pay for these regulations and therefore the impact would be minimal amongst the “billions” which these corporations make in profits. Unfortunately, the reality is that most of the cost of these regulations will be carried by the State’s ports. Goods movement is a global system of connectivity which is structured to move goods from their location of manufacture to their location of consumption. The “large multinational corporations” involved in this process have a growing amount of choice when it comes to choosing a path through this supply chain and the ports of California are not their only choice for offloading their goods. Ports in the Gulf of Mexico and in other states along the Pacific Coast can be significantly cheaper. Rates of cargo diversion away from California will increase as California ports raise their rates to help fund the needed infrastructure improvements required by these new regulations. California ports will continue to lose market share and employment opportunities for local citizens, especially in areas already suffering from a lack of middle class jobs as the costs of doing business in California continues to increase. Additionally, the local demand for goods shipped from overseas will not diminish and that market will continue to demand fast cheap shipping for a plethora of goods from fresh produce to consumer goods. These goods will still have to reach consumers in California and when shipped into out of State ports will be trucked back into local stores and warehouses resulting in significant net increases in emissions of toxic pollutants and greenhouse gases.
- As part of its conversations with CARB over the last two years of the development of this proposed regulation, the Port has sought to make clear to the CARB staff how unique the characteristics of the Port are, and how these characteristics directly impact how it would comply with the proposed regulation. Due to our size and physical constraints solutions that work for ports like Los Angeles or Oakland are typically not well suited for application at Hueneme. However, the Port sought to show CARB that we are in full support of their goals to further reduce emissions from the Port. Thus, in an effort to help ensure that currently uncaptured emissions originating from the at berth time of the currently unregulated fleet could be reduced in the most cost effective way, the Port put together a list of potential projects which could achieve significant emissions reductions in the near term future and potentially at a lower cost. These “alternatives” were brought forward in a good faith effort to show the potential for in-lieu emissions reductions which could be financed in part by those customers of the Port in the unregulated fleets. Following months of collaborative communication with CARB staff, it was unexpected to the Port that the discussion at the December 5<sup>th</sup> meeting centered around these projects in no way being undertaken in lieu of the new requirements and could be required in the interim when direct compliance was infeasible on the short term. Thus it appears that CARB intends to require the Port and its customers operating RORO vessels be required to implement

55-1

the alternative projects which the Port proposed on an earlier timeline and not in lieu of any of the requirements of the proposed regulations. As noted by some of the audience members the operation of a modern seaport berth is a highly technical, dangerous, and expensive ballet of many players all of whom play a part in successfully moving cargo safely and efficiently. In applying new regulations into this system, the “devil is in the details,” as noted by several CARB Board members during the meeting on the 5<sup>th</sup>. As implied by Board members during this meeting, if CARB were to propose a scheme in which the alternative projects proposed by the Port were to be required as a short term compliance step, any such regulation would have to ensure that it was procedurally and legally sound, scientifically valid, and equitable to those parties subject to the rule.

- In closing the Port wishes to reiterate again, that it is fully on-board with further reducing emissions from its operations and has multiple efforts underway at present including:
  - Writing in conjunction with the Ventura County Air Pollution Control District, its own clean air plan which will assess a brand new emission inventory for all Port activities and operations; and
  - Has just installed the first reference grade air quality monitors at a local elementary school which once running and calibrated will provide current air quality information to the local community; and
  - Writing a Port wide electrical master plan which will help to guide the extensive engineering analyses and future scenario assessment needed to continue the Port on its plans toward zero emissions; and
  - In 2020 installing infrastructure including switchgear, transformers, conduit and plugs to plug in a new generation of zero emission electric cargo handling equipment at the Port, and
  - Will be operating in conjunction with partners, an electric hybrid mobile harbor crane as well as a zero emissions hydrogen fuel cell Class 8 heavy duty truck prototype, and the first electric terminal trucks within the next two years.

The Port is committed to maintaining its critical role of being the economic engine for the region while growing its leadership in the path to a future of zero emission, sustainable goods movement. The Port envisions an equitable future in which economic opportunities and a clean, decarbonized environment are accessible locally and which both provide and give back to future generations.

Sincerely,

Giles Pettifor,  
Environmental Manager

Spring 2019 Comments:

Our comments on the current process include:

- It is imperative that CARB identify the potential for real and profound economic impacts (especially at smaller, niche ports) as well as increased state-wide emissions, (from the diversion of cargo to out of state ports) which may result from increased costs associated with the proposed regulation. Without a cost benefit analysis on a port by port basis the real impact of these changes cannot be ascertained. The Port wishes to document its request prior to **CARB's moving forward that the regulation process must include the completion of a full cost benefit analysis at each of the subject ports!** These costs should be made clear in comparison against the quantity of emissions that will be reduced at each individual port subject to the new regulations.
- **CARB needs to identify the quantified emission reductions it is seeking to achieve via the implementation of the new regulations.** This targeted volume reduction should then be applied to the modelled emissions of each port, on a port by port basis to determine what is the scientifically calculated emission reduction goal. Bringing verified, valid emissions data into the analyses for this regulatory process will ensure that the cost benefit analysis, which must accompany this effort, is as accurate as possible. The emissions of each port are different as well as the basin status and these characteristics should be reflected in CARB's analyses.
- CARB estimates of **port emissions for each port subject to the regulations should be scientifically valid, using the best available science and valid methodologies** that both CARB and the subject ports concur are valid. CARB's reduction target should be applied to the agreed upon inventory emissions amount to ensure fair calculation of responsibility.
- **The costs of proposed emissions reductions should be grounded in emissions costs generated for other similar State programs** such as the Carl Moyer technology retrofit program.
- Many ports statewide, including the Port, are investing in developing air quality plans specifically tailored to their own emissions inventory, physical and logistical characteristics of their cargo and waterfront setting, as well as their own community inputs and resource availability. These **local plans should be recognized when appropriate as real alternatives to the regulations and are avenues to emission reduction opportunities not currently contemplated by CARB as they are quantifying strategies to meet emission reduction goals.**

## **As follows the original fall of 2017 Comment Letter from the Port to CARB:**

### **I. Introduction**

The Port of Hueneme (Port) would like to thank the California Air Resources Board (CARB) for this opportunity to provide formal comments on the proposed amendments to the existing At Berth Regulations. The Port enjoys a long history of working cooperatively with both CARB and the Ventura County Air Pollution Control District (APCD) and looks forward to continuing these productive relationships to ensure success in future emission reduction programs.

Our collective efforts realized the installation of shoreside power vault and substation systems to enable the plug in of regulated refrigerated vessel fleets. At the forefront of new and innovative technologies, California leads not only the nation, but the world with shoreside capabilities. In leading the world with clean technology, we become the first to learn how to tackle the challenges inevitable with new technologies. This comment letter puts forth recommendations to address those challenges and respectfully requests that getting the first phase of the regulations perfected be the main purpose of the at-berth regulation amendments.

In the workshops of August 28 and September 7, 2017, CARB presented the concept of expanding its regulatory authority to new fleets, a concept which need thoughtful consideration, particularly as we continue to iron out the challenges with existing systems under the current regulations. As a partner in sustainable economic development, we urge CARB to consider the potential of very real impacts to local economies and pursue a cost-benefit analysis of the socio-economic impacts of the proposed amendments prior to promulgation of regulations mandating requirements on all vessel calls. Further, the true air quality benefit to a given air quality basin coupled with the actual costs of the expanded amendments needs to be fully understood to ensure the enactment of sound public policy consistent with the Governor's Executive Order B-32-15<sup>1</sup> which calls for transitions to zero emission, efficiency and increased competitiveness.

The Port appreciates the challenge CARB faces in drafting these regulations with a level of detail and forethought which accounts for the inherent complexities of the global maritime industry as well as the unique characteristics of California's ports and in a way which does not place an undue burden on these ports and put them at a competitive disadvantage. Working together we can find a solution that meets our mutual goals. The following comments provide important data and strategies to best inform future policy and regulation specific to the Port of Hueneme. The ultimate goal being to find a tangible pathway forward to achieve ambitious air quality improvements while supporting the economic backbone of socioeconomically distressed communities.

### **II. Environmental Profile**

#### ***Port of Hueneme's Environmental Framework***

Located at nexus of vibrant coastal communities, precious coastal wetlands, and Pacific Ocean pathways to our global trade partners, the Port takes very seriously its stewardship of the environment. As part of

---

<sup>1</sup> [http://dot.ca.gov/hq/tpp/offices/ogm/cs\\_freight\\_action\\_plan/main.html](http://dot.ca.gov/hq/tpp/offices/ogm/cs_freight_action_plan/main.html)

this responsibility the Port focuses particularly on its surrounding communities of Oxnard and Port Hueneme, its commissioning jurisdictions. The Port exists to serve these communities as an economic center providing employment, tax revenue and trade benefits for local citizens. The Port also strives to minimize potential impacts to these communities as it is nestled in adjacent to homes, schools and businesses. Due to the proximity of these sensitive receptors, air quality is of particular interest to the Port, and the Port works every day to take steps to minimize impacts to air quality. In an effort to demonstrate the seriousness with which the Port takes these duties of protecting the environment, the Port adopted an Environmental Management Framework (EMF) in 2012. The EMF outlines the strategic efforts the Port will undertake to protect the environment, and covers eight environmental elements including:

1. Community engagement
2. Sustainability
3. Air Quality
4. Water Quality
5. Soil and sediment
6. Marine resources
7. Energy management
8. Climate change adaptation

Since adopting this proactive agenda of sustainability, the Port has pursued the integration of the elements of the EMF into its daily operations as well as long term planning. Progress has been made every year since, and in 2016 the Port became the first port in California to be certified by Green Marine, the preeminent third party environmental certification organization for marine facilities. The Port is fully committed to making environmental progress in every way that it can as it grows and changes with the global economy.

While the Port moves forward with the implementation of its EMF, it must work to expend its limited resources in a manner that balances maintenance of critical Port infrastructure with investments in new equipment and technology which help the Port to comply with regulations and improve environmental performance. For this reason, the Port is continually looking for solutions that are both cost efficient and effective for the Port's characteristics, its operations and the local community.

The Port is unique in many ways that set it apart from both the large Ports of Los Angeles/Long Beach (LA/LB) and other smaller ports like San Diego or Stockton. As the Port was constructed with private funds in the 1930's it is not a California State Tidelands Port, which gives the Port more control over its operations, more accountability directly to its commissioning communities and the ability to operate more nimbly. The Port operates on 120 dockside acres and while this is smaller than other ports, the Port is very efficient with its limited space and constantly strives to use every bit of it as efficiently as possible.

### **III. Port Hueneme's Air Quality Basin and Port Emissions**

**RECOMMENDATION: Apply the attainment status of Ventura County air basin to any regulation impacting the Port and consider the emissions data and growth rates specific to the Port as opposed to that of the LA/LB air basin or the Ports of LA/LB.**

Air quality regulation respective to a port or similar emission source should begin with a very simple analysis with two major local components:

1. Basin Status - Historical and current air quality within the basin in which the port operates.
2. Emissions - Current and estimated future quantity and quality of the port's emissions.

When beginning with these two components, it becomes clear how different the Port is from LA/LB.

### 1. Basin Status

It is not just the Port's physical setting and operations which are different from nearby LA/LB, the air quality within its surrounding basin is also very different. Table 1 presents the projected dates of attainment with National Ambient Air Quality Standards (NAAQS) for the air basins surrounding both the Port and LA/LB. The ozone standards are shown as this pollutant has the potential to exacerbate respiratory illness symptoms in sensitive populations including children and the elderly and those with inflammatory airways or asthma, and is of particular concern for community health activists.

Ozone Standard	Attainment Date	
	VC Basin	LA Basin
2008 - 8hr.	2020	2032
2015 - 8hr.	2026	2037

Table 1 Comparison Dates of NAAQS Attainment for Ventura County and Los Angeles Air Basins

Table 1 makes clear that the air quality within the air basin around the Port is now and will continue to be substantially better than that of LA/LB. The air quality within Ventura County has steadily improved during the last twenty five years even while the County's population has grown by more than 30% during that time period as clearly shown in Figure 1. Despite this growth in population, Figure 2 shows that the average ozone concentrations within the County have decreased over time, driving the reductions in days over the NAAQS metric that are shown in Figure 1.

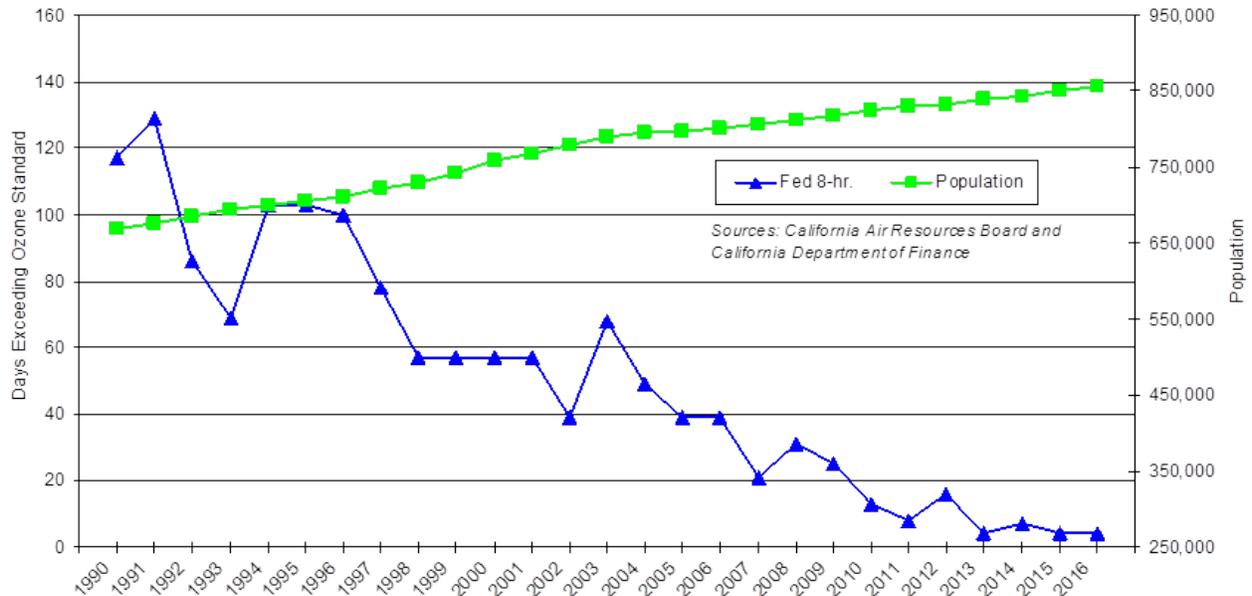

Figure 1 Ventura County Days Over Federal Ozone Standard vs. Population Growth.

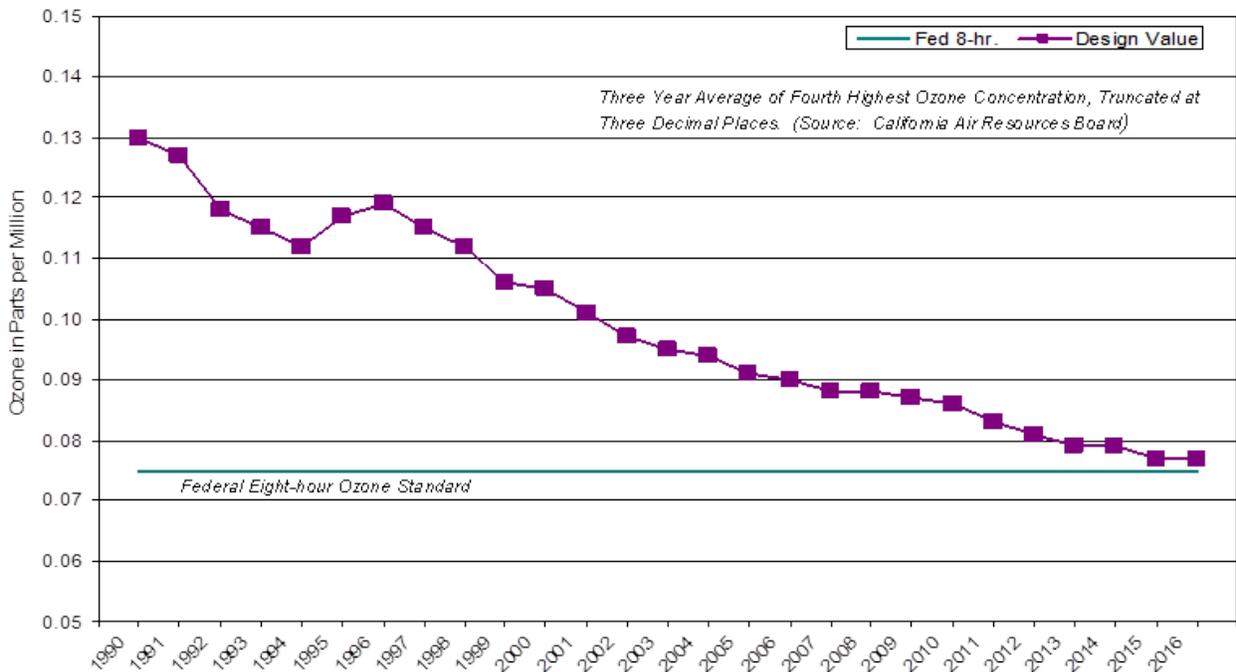

Figure 2 Ventura County 8-Hour Ozone Values

2. Emissions

**OGV Emissions**

Not only is the Ventura County air quality substantially better than that of the LA basin, a great deal of the air pollution within the air basins of Ventura County come from emissions from ocean going vessel (OGV) traffic offshore that is bound for LA/LB. The air basin over Ventura County extends three nautical miles offshore and is called the South Central Coast (SCC) Basin, while the basin which extends from three to one hundred nautical miles offshore is called the Outer Continental Shelf (OCS) Basin. CARB calculates attainment status for the SCC Basin using a photochemical model which incorporates emissions from both basins, meaning that transitory OGV emissions from LA/LB bound vessels in the OCS directly impact air quality in the SCC. When the pollutant quantities emitted by OGVs in both basins are analyzed, it becomes clear how much of a negative contribution is made by the OCS OGV, passing inside of the Channel Islands, as the majority of trans-Pacific traffic does, in transit to LA/LB.

Table 2 shows the estimated pollution contribution from OGV in both the SCC and OCS basins, while Figure 3 uses these numbers to clearly show how much greater the OCS portion is than that of the SCC basin, where the Port is located and represents a considerably low contribution to the problem.

		2020		2035	
Basin		ROG	NO <sub>x</sub>	ROG	NO <sub>x</sub>
OGV Emissions*	SCC	0.04	<b>0.84</b>	0.06	<b>1.07</b>
	OCS	0.86	<b>12.54</b>	1.6	<b>9.63</b>

Table 2. Emissions from Ocean Going Vessels within Ventura County SCC and OCS Basins<sup>2</sup>

<sup>2</sup> Ventura County Air Pollution Control District. *Final 2016 Air Quality Management Plan*. 2016

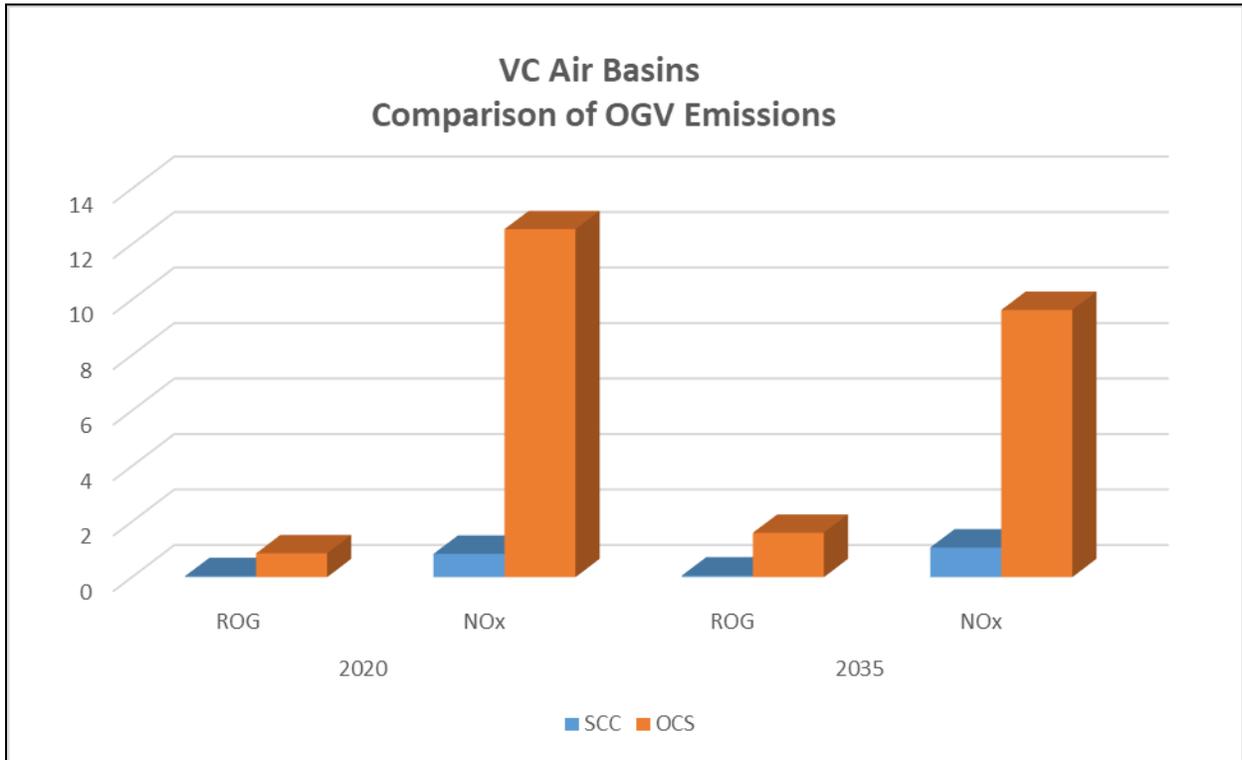

Figure 3. Emissions from Ocean Going Vessels within Ventura County SCC and OCS Basins

These numbers make it clear that Ventura County is coming from a very different place with regards to ambient air pollution levels. Essentially, the Ventura County basin's status quo is so much lower than LA/LB that it does not make sense to apply the same assumptions about emission related impacts for the Port. This point is extremely important to the proposed regulation amendments.

CARB's ongoing emission inventory analysis makes assumptions about growth rates of OGV business at California ports. CARB is applying estimated growth in OGV traffic in various vessel classes to calculate growth in emissions, rationalized by the assumption that more OGV activity means more engine use, which equates to proportional increases in emissions. During this process, the ports were lumped into regions for simplified assessments. The Port was thus included in the same region as LA/LB. Consequently, the growth rate of a significantly larger port complex with extremely different growth estimates was used in the emissions calculations as a surrogate for the Port. Due to a number of reasons, including the size constraints of the Port's berths and shore-side area, the growth rates of LA/LB are in no way accurate for the Port, and would grossly overestimate the anticipated growth of the Port and its future emissions. This would in turn overestimate the potential for impact on local air quality and potential for human health effects. The inaccurate growth numbers CARB used for the Port were: an increase in refrigerated carriers by almost 44% and roll-on roll-off vessels of over 80% by 2025. The Port has calculated as part of its own business planning a more modest growth rate of approximately 30% over 30 years. The emissions associated with this growth forecast should be applied to any policy impacting the Port.

**Criteria Pollutant Emissions**

Within the air basin of Ventura County, the Port is a fairly small contributor of pollutants as evidenced in Table 3. The Port’s emissions of all of the assessed criteria pollutants, except NO<sub>x</sub>, contribute less than one percent of the Ventura County SCC air basin’s totals! The Port has worked in the last decade to implement operational changes and new technologies to reduce emissions, such as the addition of shore power, and through investments in efficiencies to reduce delays in cargo movement. In comparison to the Port’s 2008 emissions, and despite an increase in vessel calls and goods throughput, the Port has seen a reduction in nearly all of assessed criteria pollutants including carbon dioxide, VOCs, particulate matter and SO<sub>x</sub>.

<b>Port of Hueneme Compared to Port of LA, VCAPCD, SCAQMD Emissions</b>						
<b>Criteria Pollutants</b>	<b>VOC tons/day</b>	<b>CO tons/day</b>	<b>NO<sub>x</sub> tons/day</b>	<b>PM 10 tons/ day</b>	<b>PM 2.5 tons/day</b>	<b>SO<sub>x</sub> tons/day</b>
Port of Hueneme Total	0.05	0.2	1.6	0.02	0.01	0.01
Total VCAPCD Emissions	45	169.5	60	29.1	10.5	17.0

#### IV. Economic Profile

**RECOMMENDATION: Perform a robust cost-benefit analysis to understand the impacts of the proposed Amendments to the At-Berth Regulations to both the economy and the environment for the various business segments proposed to be regulated.**

##### *State of the Local Economy and the Importance of the Port*

The Port is one of the most productive and efficient commercial trade gateways for niche cargo on the West Coast. The Port is governed by five locally elected Port Commissioners from the communities of Oxnard and Port Hueneme. The Port moves \$9 billion in goods each year and consistently ranks among the top ten U.S. ports for automobiles and fresh produce. Port operations support the community by bringing \$1.5 billion in economic activity and creating 13,633 trade-related jobs. Trade through the Port

<sup>4</sup> California Environmental Protection Agency Air Resources Board. 2015 Estimated Annual Average Emissions: South Coast AQMD [https://www.arb.ca.gov/app/emsinv/emseic1\\_query.php](https://www.arb.ca.gov/app/emsinv/emseic1_query.php) (accessed September 2017).  
South Coast Air Quality Management District. Final 2016 Air Quality Management Plan 2017 <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15> (accessed September 2017).

generates more than \$93 million in direct and related state and local taxes, which fund vital community services.

As shown in Table 4, the median household income in Oxnard is \$54,524 and \$49,627 in Port Hueneme. Both Oxnard and Port Hueneme median household incomes are lower than Ventura County’s \$71,451. Oxnard median household income is lower than the state of California and Port Hueneme median household income is also lower than California’s level of \$58,916. Port Hueneme’s per capita income is 33 percent less than Ventura County and Oxnard’s per capita income is even less than the county per capita income, measuring at 42 percent less.

	California	Ventura County	Oxnard	Port Hueneme
<b>Income: 2014B</b>				
Average Household Income	\$87,744	\$99,452	\$74,377	\$64,251
Median Household Income	\$58,916	\$71,451	\$54,524	\$49,627
Per Capita Income	\$30,268	\$32,724	\$18,921	\$21,889
Avg Income Growth 2000-2010	33.0%	31.1%	26.6%	30.9%
Avg Income Growth 2014B-2019	15.3%	14.0%	14.9%	13.8%

Table 4. Median Household Income & Per Capita Income (2014)<sup>5</sup>

**Poverty and Misery Index**

The measure is an index known as the “Misery Index,” which is made up of eight socioeconomic indicators, applied to 11 areas (called Neighborhood for Learning or NfLs) in Ventura County. The eight indicators are: the poverty rate among children age 5 and under; the percentage of women-led households with children 5 and younger who are below the poverty line; the percentage of adults 25 and older without a high school diploma; the percentage of people who speak English “less than very well”; the portion of schoolchildren eligible for subsidized lunches; the portion of students classified as English learners; and the percentage of students who tested at “below proficient” for math and language arts. The percentages are added together and weighted equally for the index.

As seen in Table 5, this index illustrates the deep socioeconomic divides in Ventura County. At one end of the spectrum is Oak Park, where more than 98 percent of the adult population has a high school diploma, and not a single child under the age of 6 lived below the poverty line in 2011. Oak Park’s score on the index the sum of the percentages on eight different risk measures — was 37.2, less than one-third the score of the next area, the Conejo Valley. In Oxnard, El Rio and Port Hueneme the total index was more than 10 times as high as Oak Park. In El Rio, for example, 45.9 percent of households led by a woman, with children 5 or younger, were living in poverty.

***Business Environment and Challenges of At Berth Regulations***

***Automotive Category***

Cargo throughput at the Port is dominated by two product lines, fresh fruit and automobiles. While demand and business for fresh fruit is fairly constant, the demand for automobiles is much more elastic and subject to broader global economic influences. The American public will likely purchase a banana in good economic times and bad, yet that is not the case with automobiles. In general, automobile transportation is a competitive business in which margins are small and competition is significant between carriers and amongst ports seeking to attract new business. In addition, many global carrier companies have large fleets of roll on roll off (RORO) vessels which travel on global routes that frequently change following the demand for specific product. For example, a global shipping company that has a significant presence in the Port and globally operates a fleet of approximately 120 RORO vessels, may only have half of their fleet call at the Port on an average year. Often, one vessel will call on the Port once a year, or once every two to five years. Due to the high costs to retrofit even a single vessel, this company would be very unlikely to retrofit all sixty vessels in order to comply with the proposed amendments. Thus, two choices would remain: the Port could purchase an emissions capture system for use by this company, or they could choose to move some portion of their automobile business to ports outside of California. The emission capture system would likely have to be a shore-side system as the Port does not have the space to be able to operate a barge mounted system and continue normal vessel operations. Yet, no shore-side systems are available as of yet, nor are any approved for use by CARB. This is an uncertain option to base compliance plans upon.

<sup>6</sup> VCCA 2015 State of the Region Ventura County Report

If shipping lines chose to pursue the retrofit of a few vessels, they would become the only ones capable of calling at California ports. However, this places the company at a disadvantage globally by having the entire state of California only serviceable by a specific set of vessels and not others. This is problematic for air quality as well, as the shipping lines will have to operate inefficiently. When vessels are not being used efficiently it results in greater emissions and high costs to the consumer. Logistically, many shipping lines will begin to look to the Pacific Northwest and Gulf ports to import their automobiles. Once imported, they will simply place them on trucks or rail and send them to California. The demand is in California, and they will find the cheapest way to get the automobiles here. Furthermore, this option leads to much more air pollution, the very consequence CARB is working so diligently to reduce.

John Martin, a nationally recognized maritime economist, conducted a study on the economic impact of the Port of Hueneme. He concluded that the Port is responsible for over 13,633 jobs, and \$1.5 billion in economic activity for the region. The study also highlighted the Port's \$93 million annual contribution to state and local taxes. If our customers decide to ship to other states, these jobs, economic activity, and tax revenues will be lost. Being located in a disadvantaged community where the city of Oxnard has a 24% poverty rate, higher than the state's average, makes the economic opportunity of the Port paramount to the citizens of this region. The Port not only provides jobs, but family sustaining jobs.

The Port's customers are not exempt from property taxes because they purchase property off Port. This means that all those imports and exports are generating the \$93 million that is then reinvested in the schools, fire, police, healthcare, social services, and even our local AQMD. The Port services three automobile shipping lines. For just one of those to relocate means a loss of one third of the jobs, economic impact, and tax revenues over night. The Martin study found that the At Berth amendments as analyzed could have the potential impact on the local economy of the loss of:

- More than 2,700 jobs; and
- \$300 million in economic activity annually; and
- More than \$200 million in salaries and local consumption; and
- \$25 million in of State and local taxes

In addition, to these socioeconomic impacts, business leakage from the Port to the Pacific Northwest ports, would have a substantial environmental costs as well. Emissions from the automobiles being delivered to distant markets like Los Angeles and Phoenix are accounted for with a U.S. Department of Transportation emission ton monetization rate. The emissions and subsequent costs resulting from vehicles being driven the increased distances to vehicle markets which are beyond that of delivery from the Port would be a cost of the proposed amendments and are shown in Table 6.

	Truck Miles		Ton Miles Penalty		Emissions Cost
	Portland to:	Huneme to:	Mileage Penalty	Ton Miles	Annual
San Francisco	645	364	281	21,053,236	\$1,462,071
Los Angeles	975	70	905	225,140,993	\$15,635,232
Seattle	171	1147	-976	-10,791,163	-\$749,407
Portland	0	975	-975	-10,852,054	-\$753,636
Denver	1252	1079	173	1,906,395	\$132,392
Phoenix	1345	444	901	36,290,883	\$2,520,271
Salt Lake City	775	752	23	258,967	\$17,984
Las Vegas, NV	982	325	657	14,125,214	\$980,945
<b>Total Emissions Cost</b>					<b>\$19,245,853</b>

Table 6. Total Emissions Costs for Vehicle Deliveries Resulting from Business Leakage from Port of Hueneme

The Martin Study identifies the worst-case scenario, but the true global nature of the Ro-Ro fleets would make the carriers very reluctant to retrofit their vessels when alternatives just up the coast and in Mexico and Canada exist. The competitive threat is very real. The extent to which the regulations could cause such leakage merits further evaluation and study for both the economic and environmental impacts before regulations are promulgated.

***Break Bulk Project Cargo Category***

Another important business segment to the Port is break bulk project cargo which contributes about 4% of the Port’s revenue. This business line is extremely important to the Port’s overall competitiveness and the thousands of jobs it supports. 100% requirement to reach zero emission for this vessel type call, would cause the industry to virtually disappear. These vessels make one time calls to ports to load and unload special cargoes, and may never return for another call at the Port. By way of example the largest crane in the world from Arizona, came to Hueneme for a one time move to China. These types of pieces frequently move through the Port on a different vessel on each occasion. A retrofit would not be justified in the eyes of an ocean carrier for a single voyage, thus potentially eliminating this business segment at the Port.

To best understand the implications of the proposed amendments, all business types at the Port need to be evaluated and the opportunity costs understood, again calling the need for a cost-benefit analysis to inform the draft regulations.

***Tanker Business Category***

The Port operates a distribution hub for liquid fertilizer product which is an essential tool for the massive agricultural industry of Ventura County. This \$2 billion industry relies of timely delivery of fertilizer which is delivered to the Port by tanker vessel currently service by the Champion Tankers line. Champion operates about 20 tankers globally approximately six of which may visit the Port annually. This vessel category is subject to many of the same global economic challenges as any other ocean carrier and thus would reflect the same business challenges in justifying an expensive vessel retrofit or the risks of developing a fleet of captured California-only tankers.

**V. Proposed Elements for Inclusion in At Berth Amendments**

The Port is providing these comments not out of any effort to avoid regulation or doing its part to improve air quality in the region. The Port is fully committed to making progress to reduce emissions at the Port in a manner that is effective in addressing the pollutants which are most problematic in the surrounding areas and cost effective in reducing those emissions. It is clear to the Port that a one size fits all compliance pathway will not be effective in fairly applying emission reductions across the ports of California. Furthermore, smaller ports like Hueneme and its surrounding communities which rely on the Port for employment, will carry a much greater burden and are more at risk of serious negative economic consequences if the proposed amendments move forward without specific accommodations for smaller ports including Hueneme.

For these reasons, the Port would like to propose the following solutions to integrating a more equitable and realistic approach into the proposed amendments.

#### **Alternative 1: Fix Current At-Berth Regulations**

Under this alternative the Port recommends that the proposed amendments be shelved until the problems effecting the current regulations are solved. Presently under the existing At Berth regulations, several problems impact compliance attainment for vessels and fleet owners, and the Port believes that air quality would best be served by fixing these challenges before adding significant increases in the breadth of these regulations and thus compounding the level of regulatory complexity and compliance challenges by orders of magnitude. The current three hour plug in rule for shore power seems to be an arbitrary number which is difficult under even the best circumstances for a vessel to comply with. In numerous instances small delays or unforeseen events result in connections taking more than three hours, and missing the mark eliminates any incentive for continuing the attempted connection and thus negates potential emissions reductions. A sliding scale of compliance could be contemplated in which the duration at berth under shore power would be applied to a compliance total. A second confounding factor is the limited availability of technology vendors capable of providing support, system service and spare parts for shore power systems. Currently one company services all of the shore power systems in the State with one electrical engineer, this scenario leads to significant delays in servicing shore power equipment which results in vessel calls operating off of ship power and resulting emissions. It is challenging to not envision a situation in which these same types of problems will plague the emission reduction technologies which are currently being touted as significant solutions to reducing emissions from vessels including bonnet capture systems or similar technologies with the proposed amendments.

#### **Alternative 2: Delayed Application of Requirements and Development of Local Air Plans**

Under this scenario, smaller ports would fall subject to the proposed amendments after a set period of time such as ten years. During this intervening period, smaller ports would continue to be subject to the current At-Berth regulations. During this time, larger ports would be working with industry to develop and refine emissions control technologies including bonnet capture equipment and on-board scrubbers to such a degree that initial problems typical of any new technology could be worked out before they are required in all ports. Presently there are already problems with getting the resources needed from technology vendors to support ports with shore-side power systems in need of repair, and it is easy to envision a similar situation occurring with bonnet capture systems in the future. By implementing a delay for small ports, owners of vessel fleets visiting smaller ports would have time to assess new technologies and make informed decisions about retrofitting their fleets with new emission control technologies. In addition, smaller ports would have time to pursue the additional funds needed to invest in emission control technologies such as bonnet capture systems.

In addition, CARB had requested from the Port and its customers estimates of a specific cost point, a “tipping point” at which the burden on complying with the proposed amendments would drive business to leave the Port and move to a less expensive port such as Portland, Tacoma or the Gulf Coast. In discussion with customers of the Port, it has become clear that they are uncomfortable disclosing or even discussing such a cost due to the sensitive nature of disclosing strategic business planning with such detailed proprietary financial information, particularly in the highly competitive business segment of global vehicle shipping. However, one benefit of delaying the application of the proposed amendments to the smaller ports would be that in the interim time market forces would reach equilibrium between vendors of new control technologies and vessel owners and port authorities and make more clear how the increased regulatory costs of the At Berth amendments translate into increased operational costs and a resulting loss of business to other regions with lower compliance costs. This approach creates the opportunity to quantifiably measure leakage without impacting the most vulnerable ports. Delayed implementation would also enable ports time during which to begin coordination with local air pollution control agencies on developing local solutions.

### **Alternative 3 - Regional Targets and Solutions**

Under this scenario, ports would be allowed to achieve compliance with the proposed amendments through the implementation of a locally developed plan which would achieve reductions in air pollutants equivalent to those of the proposed At-Berth amendments but through other efforts. A large percentage of the emission reductions, such as 75%, would have to take place at the port or adjacent port owned properties so that the benefits of these plans would be felt in the immediate communities around the ports which are most impacted by their emissions. These plans would be tailored specifically to a port’s surrounding air basin, including NAAQS attainment dates, and its community needs and problem pollutants. These plans would be developed in partnership with their local Air Pollution Control District or Air Quality Management District with final approval from CARB.

The Port has begun the collaborative development process of a more comprehensive air quality plan that the Port is calling its Port of Hueneme Reducing Emissions and Supporting Health Plan (PHRESH Plan). The PHRESH Plan will be focused on developing Port specific strategies for reducing air pollutant emissions within the Port’s direct operations or financial control. The PHRESH Plan will be tailored to the Port’s features, equipment and operations and will assess a range of feasible reduction methodologies and source control technologies which could be implemented. The focus will be on achieving the most cost-effective solutions that provide the greatest amount of feasible reductions.

*Additional Specific Comments on Proposed Amendments to the At Berth Regulations*

Comment #1:

The Port strongly encourage CARB to conduct a socioeconomic assessment of the proposed amendments incorporating a full cost-benefit analysis due to the potential impacts of the concepts currently being discussed. As outlined above, the Port cannot emphasize enough the potential of economic harm which could result from the loss of small numbers of customers at the State's smaller ports.

Comment #2:

The Port frequently receives military cargo for the U.S. military which arrives on civilian vessels. The Port requests that CARB clarify if this situation would result in the vessel being exempt from the regulations due to the nature of its cargo.

Comments #3:

Some vessel lines are already developing and launching new vessels which call at the Port which incorporate onboard emissions controls technologies. The Port requests that CARB clarify whether this type of vessel will be exempted from the regulations or be grandfathered in.

Comments #4:

The Port requests clarification on the size of tanker vessels which will be subject to the regulations.

Comment #5:

There was discussion during the workshop of requiring ports to report vessel data to CARB under a new, streamlined reporting regimen. The Port requests clarification of this change and notes that altering the nature of the relationship between the Port and its clients could negatively influence it especially when regulatory compliance documentation is involved.

Comment #6:

The Port's customers encourage CARB making available grant funding or other incentive to offset the significant labor costs associated with shore power connections, which can total over \$5,000 per call and at times exceed the cost of electricity used during the call.

We greatly appreciate the opportunity to provide these comments, and we look forward to working with CARB further on this important regulatory action. Please contact us if you have any questions or comments regarding this letter or its contents.

Sincerely,

Christina Birdsey,  
Chief Operating Officer,  
Port of Hueneme

WORLD SHIPPING COUNCIL  
PARTNERS IN TRADE

**World Shipping Council Comments**  
to the  
**California Air Resources Board (CARB)**  
on the  
**Proposed 15-Day Changes to the Control Measure**  
**for Ocean Going Vessels at Berth**

1 May 2020

The World Shipping Council (WSC) is a non-profit trade association that represents the liner shipping industry, which is comprised primarily of operators of containerships, vehicle carriers, and roll-on/roll-off (ro-ro) vessels. Together, WSC's members operate approximately 90% of the world's liner vessel services. Vessels operated by WSC members make frequent calls in California ports, and WSC's members would be directly and substantially affected by the proposed rule.<sup>1</sup>

On 9 December 2019, WSC filed lengthy comments, with specific and practical recommendations to address each comment, with CARB on its proposed control measure for ocean going vessels at berth. We appreciate that CARB has incorporated several of our recommendations into its package of 15-day changes to the proposed rule. We are concerned, however, that CARB has not addressed a number of important policy recommendations that would help ensure California's updated at-berth regulations are practicable, provide a fair and reasonable compliance pathway for regulated vessels, and achieve the state's emissions reduction goals.

Before turning to our detailed comments on the 15-day changes, we first wish to comment on two critical issues: 1) the impact of the COVID-19 pandemic on the regulated community's ability to implement the rule according to the planned implementation schedule, should the rule be adopted by the Board, and 2) the rule's planned expansion to new classes of vessels, namely ro-ro vessels, on an accelerated timeline, despite the lack of compliance options for these vessels and no detailed cost-benefit analysis supporting this move.

---

<sup>1</sup> A full description of the Council and a list of its members are available at [www.worldshipping.org](http://www.worldshipping.org).

Impact of COVID-19 Pandemic: The world is grappling with arguably the worst pandemic in more than a century. To prevent the spread of COVID-19, citizens and companies around the world are living and working under severe restrictions. The resulting global economic contraction is deepening and causing tremendous uncertainty for consumers and the shipping industry that supplies and feeds them. Shipping companies and many other businesses are struggling to remain in business as demand has plummeted. Shipping industry efforts are focused on maintaining services, keeping crews safe and transporting relief supplies.

While CARB has been working for the past several years in collaboration with the regulated community on amendments to its at-berth regulations, no one could have predicted that the COVID-19 outbreak would occur just as the proposed rule was being finalized. The rule will require a range of substantial changes that are operational, procedural and infrastructure-related. While we understand the motivations to take the proposed rule forward to the Board for approval, we have serious concerns about the ability of liner vessel operators and the parties that they must rely on to comply with the rule (ports, terminals and emissions capture system operators, etc..) to implement the rule by 1 January 2021. **We therefore respectfully recommend that CARB delay formal action and implementation of the rule until after the COVID-19 outbreak is under control and the regulated community can properly implement the rule’s requirements.**

Expansion to Ro-Ro Vessels: We continue to have major concerns with CARB’s proposal to expand, and now accelerate, the applicability of the at berth regulations to ro-ro vessels (including vehicle carriers), which comprise a large number of discrete vessels, only a small percentage of which make infrequent and very short port calls in California. **No evidence has been presented by CARB that demonstrates that a cost-effective and practicable pathway exists for controlling ro-ro vessels’ auxiliary emissions. CARB’s analyses also fail to address the major operational, safety and cost issues the proposed emissions capture systems pose for ro-ro vessels or to account for the emissions generated by these control systems and the tug boats need to maneuver them to and from the vessels.** In short, there has been no compelling data presented that supports or concludes that the emissions generated at berth by these ships is significant or that the cost per ton of emissions reduced warrants the extensive investments that regulation here would require.

57-1

WSC’s comments and recommendation on CARB’s 15-day Changes the Proposed Regulation Order follow for your consideration. Questions on these comments should be directed to Doug Schneider of the WSC staff at [dschneider@worldshipping.org](mailto:dschneider@worldshipping.org).

1. Definitions (Section 93130.2 (b)):

- a. Ready to Work: CARB proposes to replace the references to the U.S. Coast Guard and U.S. Customs and Border Protection with “*all government authorities with jurisdiction over the vessel visit*”. We support this change as it addresses the fact that “Ready to Work” should not occur until any government entities that has jurisdiction over the vessel visit has cleared the vessel. **While the above described change is helpful, we recommend that**

CARB insert in the amended definition the following after “*netting down*” and before “*all*”: “, the ramp is down and secure (if applicable), required shore side labor technicians are present, and”. These changes to the “Ready to Work” definition are needed to accommodate vessels equipped with ramps (which would not therefore use a gangway) and to note the presence of labor technicians that are essential to hooking the vessel up to shore power or to an alternative compliance method.

- b. Visit: CARB proposes to add language to this definition that states that “a vessel move from one berth to another is considered a new visit at each subsequent berth”. **We recommend that the words “at a different marine terminal” be inserted after the word “another”** so shifts within a single marine terminal, which occur infrequently but may be done when an operational problem is encountered at the initial berth, would not constitute a new vessel visit. To correspond to the above change, the words “at a different marine terminal” must also be inserted after the word “berth” in Section 93130.7(e)(4)(I).

2. CARB Approved Emissions Control Strategy (CAECS) Operators (Section 93130.5):

- a. Executive Order (Section 93130.5 (a)): We support CARB’s proposed amendments to this section, as they make clear that emissions control strategy operators must be approved by CARB and eliminate confusion about the Executive Order’s applicability to emissions control strategies that are deployed not from the terminal or port property, but from a barge.
- b. Requirements for CARB Approval (Section 93130.5 (d)): Under current CARB at-berth regulations, LNG-fired auxiliary engines are treated as an approved control option. The proposed rule would, however, require time-consuming and costly testing of LNG-fired auxiliary engines before they may apply for CARB approval. This will discourage investments in a promising alternative to oil fired auxiliaries. We therefore recommend that CARB retain the provisions in the current at-berth regulations that designate LNG-fired auxiliaries as an approved control option.

3. Vessel Operator Requirements (Section 93130.7):

- a. General Requirement (Section 93130.7): Section 93130.7 contains checklist items that a commissioned shore power equipped ship will **not** be able to complete unless the terminal/port and/or CAECS operator completes their obligations under the rule. Section 93130.7’s statement that “Any failure to perform any specific items in this section shall constitute a separate violation...” could thus be used to penalize a shore power equipped ship that **cannot** complete all of the vessel checklist items in 93130.7(e) because the terminal/port or CAECS operator failed to meet its rule obligations.

**To correct this issue, we recommend that the second sentence in the opening paragraph of Section 93130.7 be replaced with:**

*“Any failure to perform any specific items in this section shall constitute a separate violation for each calendar day that the failure occurs, except to the extent a vessel operator cannot perform any requirement due to (1) a terminal and/or port’s failure to comply with the portions of this Control Measure that impose requirements upon terminals and/or ports, and/or (2) a CARB Approved Emission Control Strategy Operator’s failure to comply with the portions of this Control Measure that impose requirements upon CARB Approved Emission Control Strategy Operators.”*

- b. Shore Power Requirements (Section 93130.7 (a)): CARB proposes to replace the words “compatible shore power berth” with language that requires vessels to be plugged into shore power on visits to terminals where the port or terminal has commissioned the vessel’s shore power equipment or deemed the vessel to be compatible based on the vessel’s previous commissioning to another berth. While CARB’s intent with these changes may be to eliminate confusion with respect to the meaning of the term “compatible”, further changes are needed to make it clear that the port or terminal may not use this provision to dictate to vessels on which side they must be able to plug in to shore power. **We therefore recommend that 93130.7 (a) be replaced with the following:**

*“(a) Shore power requirements for at berth emissions reductions.*

*Vessel operators with shore power vessels that have been commissioned by the terminal (or port) at which the vessel will call (or deemed compatible based on a previous commissioning) shall plug in to shore power on each visit to the terminal. Commissioning of vessel shore power equipment should be based on the following technical standards: IEC/ISO/IEEE 80005-1/80005-2 and IEC 62613-1.”*

- c. Compliance Dates and Applicability to Ro-Ro Vessels (Section 93130.7(b)): As noted in the introduction of these comments, the proposed rule and supporting analyses have failed to provide an adequate rationale and analyses of the costs and benefits of regulating ro-ro auxiliary emissions. CARB is now proposing in Table 1 to advance the compliance date for ro-ro vessels one year to require compliance starting 1 January 2024.

CARB has estimated that the control cost per ton of emissions reduced for ro-ro vessels is \$53,600. Even using that cost estimate, which we believe is low<sup>2</sup>, it is worth noting for comparison that CARB estimated that the control cost per ton of emissions reduced for containerhips is \$13,500. When asked what cost-benefit threshold was used to decide which classes of vessels to regulate and which not to regulate, CARB staff reported that there is no threshold and that the decision to regulate ro-ro emissions was

---

<sup>2</sup> Starcrest Consulting Group, LLC, published in December 2019 a ro-ro cost analysis study for PMSA and the Ports of Los Angeles and Long Beach. The study estimated that the costs to control ro-ro auxiliary emissions ranges from approximately \$115,000 to \$200,000 per weighted ton of emissions. A copy of this study may be found in the CARB at-berth docket at: <https://www.arb.ca.gov/lispub/comm/bccommlog.php?listname=ogvatberth2019>.

based simply on aggregate emissions. There has been no considered analysis of the costs and benefits of regulating ro-ro auxiliary emissions versus the operational realities associated with regulating this class of vessels, which is comprised of a large number of discrete vessels, only a small percentage of which make infrequent and very short port calls (on average 14 hours and short as 8 hours) in California. We also note that ro-ro auxiliary emissions occur in distinctly different geographic locations, where their impacts and the related cost-benefit analyses for controlling those emissions may be quite different.

Furthermore, shore power infrastructure for ro-ro vessels is not emerging in California ports or in any other U.S. or international ports where ro-ros call. This is because: ro-ros operate less like liner vessels and more like tramp vessels (without scheduled, recurring calls to defined port calls<sup>3</sup>), making shore-side power infrastructure difficult to set up; ro-ros would need to go through expensive electrical system retrofits because container-based shore power units (e.g. AMP's) are not a realistic option; and ro-ros don't typically carry dedicated electricians that container vessels have (because ro-ros don't carry refrigerated containers).

CARB is predicating its regulation of ro-ros on the premise that barge or land-based emissions capture and control technologies will become a viable and practicable emissions control option. Experience to date with the two-existing barge-based capture and control service providers has demonstrated that those services are often unreliable, are exceedingly costly, and would pose substantial operational and safety problems for ro-ros. For example, that systems cannot be used in windy weather, cannot always reach ro-ro stacks (which may be 40 meters laterally and 40 meters above the waterline), and often prevent simultaneous alongside bunkering operations. If ro-ros cannot bunker in port, they may be forced to bunker at anchorages, which would generate auxiliary emissions as well as primary engine emissions from tugboats used to move bunkering barges to and from the anchorage.

We also note that barge-based capture and control systems need to be moved into position, by tugboats after the ro-ro has been secured to the pier. This consumes a substantial amount of time, which increases the cost of control per hour of emissions because ro-ro calls are already very short. A related factor that has not been adequately considered is the tug emissions generated to move the barge-based capture and control system to and from the ro-ro vessels and other vessels that may require barge-based emissions control strategies. As a result, emissions from tugboat operations can significantly offset the emissions reductions gained by requiring ro-ro to use capture and control systems during their vessel calls. The capture and control systems also use

---

<sup>3</sup> Within the ro-ro industry, the term "semi-liner" is used to describe ro-ro operations. It is often the case that ro-ros that call California do so as part of "round the world" (RTW) services, which means, by definition, the vessels in those services are infrequent visitors to California. A typical RTW service takes about 4 months, so vessels operating in those services may only make 2-3 calls to California per year.

generators for power that need to be factored into the total impact analysis for regulating ro-ro auxiliary emissions.

Shore-based capture and control systems also pose problems for controlling ro-ro emissions. While one land-based system is being trialed (and we do not know if it is being trialed for use with container ships or ro-ros, which is an important operational distinction), no commissioned land-based systems exist today. We understand that land-based systems would not be a practicable control option at many existing California ro-ro terminals because the piers on which the shore-based control systems would sit could not support the weight of the systems. Furthermore, such systems could only serve one vessel at a time and would obstruct cargo operations as ro-ro stacks are located near the stern where the ramp is located. Ro-ro operators need to be able to stage, maneuver and park cargo all along the already space-constrained quay side. Even if this technology could be built and deployed, the limitations related to use of the systems in windy weather remain as does the need to factor in the generator GHG emissions the control systems would produce.

57-2

**For the reasons discussed above, we recommend that CARB not proceed with plans to regulate ro-ro auxiliary emissions in 2024 and instead monitor ro-ro emissions and the ongoing development of technologies that may in the future provide a viable and economically achievable compliance option for these vessels.**

d. Vessel Compliance Checklists (Section 93130.7 (e)):

- Shore Power Connection Time: While we appreciate that CARB proposes to modify § (3) (A) to require vessels to begin using shore power or another CAECS within two hours after “Ready to Work”, we still have concerns that a substantial number of arriving vessels would be unable to meet this requirement. As we have previously noted, establishing shore power connections must be done safely by longshore technicians, who may not be immediately available given their other extensive responsibilities. Unreasonably short time limits for connecting high-voltage systems could pose safety risks to workers, result in unnecessary damage to the equipment, and subject a substantial percentage of compliant vessel calls to noncompliance for tasks the vessel cannot control.

57-3

One of our Member lines that has large number of shore power compatible vessels calling at terminals in California computed how the proposed connection time would affect that company’s compliance rate. Using data for 265 vessel calls in 3 ports from 2019-2020, the company found that under the proposed requirement to connect within two hours after “Ready to Work”, between 14 and 18% of vessel calls would fail to comply. A two-hour connection deadline remains unacceptable and would subject a large percentage of otherwise compliant vessels to penalties. **We therefore recommend that vessels be required to begin using shore power or another CAECS within three hours after “Ready to Work”.**

- Shore Power Disconnection Time: § (3) (B) would require vessels to cease using shore power no sooner than one hour before “Pilot on Board”. There will be situations in which this is not a practicable disconnection deadline for ocean carriers because of delayed vessel departures due to weather or vessel traffic or if labor unplugs the vessels early due to their own shift schedules. Using data for 265 vessel calls in 3 ports from 2019-2020, a WSC member line that has substantial operations in California found that under the proposed requirement to disconnect no sooner than one hour before “Pilot on Board”, between 9 and 11% of vessel calls would fail to comply. **We therefore recommend that the shore power disconnection time be no sooner than two hours before “Pilot on Board”.**
  - Post-Visit Reporting: CARB proposes in § (4) to require reporting of information for each visit to a California terminal within 30 days of vessel departure instead of the previously proposed 7 days of vessel departure. While we support the proposed modification as it is an improvement over the previous proposal, **we recommend that CARB consider allowing vessel operating companies to submit batched visit information for all of their vessels that call California on a monthly or quarterly basis. We also recommend that CARB develop an online system/dashboard into which each vessel (and terminal) operator would upload its post-visit reports. The dashboard should provide each operator with an updated snapshot of its compliance as well as VIE/TIE allowances versus usage and other relevant metrics for the designated fleet.**
4. Vessel Visit Exceptions (Section 93130.8): We continue to support CARB’s inclusion in this section of all vessel visit exceptions, including those for safety and emergency events, vessel commissioning, research, previously unregulated vessels, vessels visiting low activity terminals, vessel incident events (VIE) and terminal incident events (TIE), remediation fees, and innovative concepts. We also support CARB’s inclusion of a procedure for dealing with situations in which a vessel is unable to complete an at-berth system commissioning visit in a single call to the terminal.
5. Terminal Operator Requirements (Section 93130.9):
- a. General Requirement: We continue to support CARB’s decision to include in the proposed rule clear and appropriate obligations for marine terminals and ports to, among other things, provide the shore side infrastructure to connect ships to at-berth power and to connect commissioned ships in a timely manner when they call. These are functions that commercial ships cannot themselves perform and lack commercial power to require. Including these requirements in the regulation will establish balanced obligations for ships and the terminals they call and will set clear expectations regarding what ports and marine terminals will need to do to fulfill their obligations under the rule.

- b. Commissioning (Section 93130.9 (a)(2)): While we do not believe it was CARB's intent, the proposed amendment could be read as allowing ports or terminal operators to dictate on which side vessels seeking to have their installed shore power systems commissioned must connect. This is unacceptable. Vessel operating companies have spent billions of dollars to retrofit vessels to be able to connect to shore power pursuant to CARB's regulations. Vessel shore power equipment is designed to enable the vessel to connect to shore power on one, but not both, sides and the vessel has no ability to quickly switch the equipment to the other side. We see no reason why this section needs to include a reference to the location on which the shore power equipment is installed. **We therefore strongly recommend that this provision be replaced with the following: "(2) The port or terminal is responsible for commissioning vessels fitted with installed shore power equipment."**
6. VIEs and TIEs (Section 93130.11):
- a. Exclusion of Innovative Concept Visits in VIE and TIE Allocations (Section 93130.11 (a)): We support the allocation of VIEs based on company vessel fleets and support CARB's proposal to exclude from the annual VIE allocations visits made under an innovative concept covered under Section 93130.17 of the rule.
- b. VIE and TIE Rates (Section 93130.11 (b)): The table on page A-39 of the proposed rule indicates that all vessels would be granted VIEs for 5% of their previous year vessel calls. Terminals would initially be granted TIEs for 15% of the terminal's annual vessel visits. That allocation would fall to 5% in 2025. We think that the VIE percentage needs to be increased to account for the fact that this proposed rule will require all containerships and refrigerated cargo vessels to use at-berth power when the rule becomes effective. While many of the issues that have previously prevented commissioned vessels from connecting to at-berth power have been shore side infrastructure-related, we anticipate, based on historical compliance data, that more than 5% of vessel fleets will be unable to comply due to onboard equipment problems, the need to rotate vessels into and out of California services for required surveys and dry-dockings, and due to unpredictable commercial demands that may require shipping companies to deploy or phase-in non-commissioned vessels to meet U.S. import and export trade needs. Furthermore, there are only two CAECS currently in operation and they offer services only in the Ports of Los Angeles and Long Beach. The lack of available CAECS (e.g. in ports such as Oakland) reinforces the need to temporarily increase the VIE percentage. **With the above considerations in mind, we recommend that CARB temporarily increase the VIE allocation for 2021-2024 to 10 percent per year.**
- c. Requests for Additional VIEs and TIEs (Section 93130.11 (c)): We support CARB's proposed process through which a vessel operating company may request additional VIEs to accommodate either a new fleet or growth in the number of visits for an existing fleet. **Since vessel operators may encounter situations that warrant additional VIEs that could not be anticipated by 1 December, we recommend that CARB modify 93130.11 (c) by**

inserting the following after the third full sentence: *“(Note: CARB staff will consider, and respond within 60 calendar days, to written requests for additional VIE and TIEs submitted at any time during the year)”*.

- d. VIE and TIE Expiration (Section 93130.11 (d)): The proposed rule states that VIEs and TIEs would expire on January 31 of the year after they are granted. To address consistently challenging market conditions during the winter months, **we recommend that CARB allow companies to carry over any unused TIEs or VIE until June 30 of the year after they were granted.**
7. CAECS Operator Requirements (Section 93130.12): We commend CARB for including in this proposed rule responsibilities and requirements for CAECS operators. Since these operators will provide essential emissions control services, it is logical that the operators themselves will be subject to checklist obligations and penalties for failing to meet their obligations under the rule. This is particularly important given the historical problems vessel operators have encountered with CAECS operators who, despite having a confirmed booking and contract with a vessel operator, may not show up on time, may cancel a booking on short notice or may breakdown during control operations. When a vessel or marine terminal contracts for CAECS services, the vessel or marine terminal cannot control whether and when the CAECS operator shows up or provides proper control services.

**We therefore recommend that, when a CAECS operator fails to provide contracted emissions control services to a vessel or marine terminal, the compliance burden and any penalties for noncompliance be initiated solely against the CAECS operator.** We also recommend that CARB amend the visit reporting deadline for CAECS operators consistent with our recommendations for vessel visit reporting (discussed above in part 5.c.iii of these comments).

WSC also believes, as we have communicated in earlier meetings and comments, that it is important to discourage or restrict the use of alternative control emission control technologies in container ports where the clear objective of the existing rule was to facilitate connections to shore-side power. **Encouraging or facilitating further expansion of alternative emission control technologies in container terminals undermines the investments made in retrofitting the container fleet and could lead to an absurd and unfavorable outcome in which shore-power equipped container ships are expected to use alternative emission control technologies that are inefficient, often unreliable, and only available at high cost.** In short, expansion of emission capture systems in container terminals and ports undermines existing carrier investments and undermines the rules effectiveness in delivering emission reductions that are achieved through the most cost-effective and efficient pathway.

8. Terminal and Port Plan Requirements (Section 93130.14): WSC supports the provisions that require CARB approval of shore-side infrastructure plans applicable to ports and terminals. How well these obligations are implemented will have a significant impact on the

future program and whether the rule delivers the expected air quality benefits. We note that the port and terminal plan submission deadlines occur, for container, refrigerated cargo and passenger terminals, six months *after* the vessels that call those ports and terminals must comply with the rules. **We strongly encourage CARB not to initiate penalties against vessels that encounter compliance difficulties at ports and terminals where the shore power infrastructure is not yet fully in place.**

**WSC also believes that there would be value in explicitly articulating in the revised rule that port and terminal plans should include, among other things:** a) appropriate changes to existing infrastructure design (e.g., inadequate electrical sub-station/electrical vault configurations); b) expansion of existing electrical infrastructure in container ports to accommodate future rule requirements to enable 95% of all shore power equipped container ship calls to be accommodated through shore-side power; and c) that approved plans include a realistic timeframe for design and construction consistent with the final regulatory dates promulgated in the final rule.

9. Interim Evaluation of New Control Technologies (Section 93130.14 (d)): Should CARB proceed with plans to regulate ro-ro auxiliary emissions, the interim (now 2022) evaluation of control technologies and landside infrastructure will be essential in determining if operationally-practicable controls of ro-ro emissions are commercially available and cost-effective. **If CARB's interim evaluation determines that such control technologies are not practicable and commercially available at the terminals used by ro-ro vessels, then CARB will need to push back the compliance deadline. We also recommend that CARB include in its interim evaluation a detailed cost-benefit analyses for controlling ro-ro auxiliary emissions using available control technologies.**
10. Remediation Fund Users (Section 93130.15): **We recommend that CARB expand the list of circumstances in which vessel operators may use the remediation fund to include vessels that make infrequent calls to California ports (e.g. less than 3 calls per year).** This is a logical regulatory approach for addressing infrequent calling vessels (e.g. vessels rotated in to California to address increased demand or "extra loaders" brought in to ease port congestion) because it would enable the vessels to have a compliance option if CAECS operators, which have limited operations, are not available or operational for a particular visit. **We also request that CARB confirm that if a vessel's request to use the remediation fund for a particular visit is denied by CARB, the vessel may use a VIE for that visit instead of being subject to penalty action.**
11. Innovative Concept Compliance Option (Section 93130.17): WSC supports in general CARB's proposal to include the use of innovative concepts as compliance options for regulated parties to reduce emissions. We are concerned, however, that some of the conditions for approval of an innovative concept are unreasonable and may make it impossible or at least highly improbable for an innovative concept to be approved. **We therefore recommend the following changes to Section 93130.17:**

- Delete § (a) (3), which would unrealistically require reductions “in excess of any other state, federal or international rule, regulation, statute or any other legal requirement...”;
- Amend § (a) (4) by replacing “three” with “ten” in the last sentence. This change would allow for emissions reductions up to ten miles away from the port or marine terminal called by the vessel;
- Amend § (a) (7) by increasing the length of the compliance period to five years, which is more reasonable given the amount of analysis and effort needed to prepare and obtain approval of an innovative compliance option;

12. Summary of Responsibilities (Section 93130.17): We offer the following comments on Table 6:

- We support the inclusion of “CAECS operator” as a responsible party for circumstances in which there are delays, but emissions reductions occur.
- The last row suggests that in the case of a CAECS failure, the vessel, terminal and the CAECS operator would be held responsible. We note that nowhere else in the matrix is a party held responsible for a circumstance completely outside of its ability to control. An arriving vessel has absolutely no ability to control whether a CAECS system will work properly. The proper function and maintenance of a CAECS is up the CAECS operator. **We therefore recommend that “vessel” be removed from the list of responsible parties when a CAECS has a failure.**

**Subject: COMMENTS ON PROPOSED 15-DAY CHANGES TO THE CONTROL MEASURE FOR OCEAN-GOING VESSELS AT BERTH  
FROM CRUISE LINES INTERNATIONAL ASSOCIATION (CLIA)**

Dear Clerk:

Thank you for the opportunity to comment. CLIA has appreciated working with CARB staff during the informal and formal process for this At-Berth Regulation. CLIA will also be signing on to the PMSA Coalition comment letter on the proposed At-Berth Regulation and agree with their comments. CLIA also agrees with the World Shipping Council comments. This letter outlines the concerns with the proposed At-Berth Regulation that are cruise-line specific:

**GENERAL COMMENTS:** It is still the position of the cruise lines and other industry coalition vessel operators that this new proposed regulation should not go forward for the existing regulated fleet. Instead, we believe corrections to the existing rule for currently regulated fleets would still achieve similar emission reductions without requiring the cruise lines and cargo vessels to completely change their reporting and methodologies that took many years to develop in order to be compliant with the regulation. Having to comply with the new regulation while cruise lines are grappling with the severe economic impacts to this industry as a result of COVID-19 will be unnecessarily difficult. Although CLIA appreciates the many changes that staff has included in this latest draft, the cruise lines continue to have major concerns that this regulation will result in non-compliance for vessels that have been complying with shore power technology since 2014. The draft regulations have also already caused the loss of cruise line visits for those vessels that visit California ports only two to four times per year. This is because, unlike other types of vessels, the only option for cruise lines to comply with this regulation currently is the use of shorepower. This pending requirement necessitated that companies with vessels that call infrequently in California that do not have shore power make the decision to yield calling on ports in California.

58-1

**COMMENTS SPECIFIC TO CRUISE VESSELS:**

CLIA provided detailed comments on the previous version of the At-Berth Regulation on December 7<sup>th</sup>, 2019. Those comments are still relevant to this 15-day version of the regulations and appear in a shortened form below along with comments related specifically to the revisions in the 15-day draft.

**“Previously Unregulated Vessels” Definition, Loss of Fleet Average System, and Elimination of “Non-frequent Flier Rule”:** These regulations still extend the compliance date for non-frequent fliers in currently regulated fleets by two years to 2023, which is appreciated. Unfortunately, this amendment came too late for non-frequent fliers with cruises scheduled in 2020 and 2021, which has already resulted in changed itineraries to avoid calls in California for those two years and beyond. The ISOR and SRIA do not properly analyze the possibility of vessel diversions and their economic impact. These infrequent cruise vessel calls are particularly subject to diversion. This is especially true without the existing fleet average compliance system, which could allow the cruise lines to accommodate these non-frequent fliers. Out of hundreds of cruise vessels worldwide, only a limited number continually visit California and are equipped with shorepower. The more specialized world cruises and relocating cruise vessels may visit

California once every two to four years and only a few ports each visit, using entirely different cruise ships each time. **This means that these vessels would be able to use these \$2 million systems only 8 – 16 hours every one or two years.** We agree with the World Shipping Council that the remediation fund should be expanded to allow vessels making infrequent calls to use the fund.

**Vessel Incident Events (VIEs) and Terminal Incident Events (TIEs):** Rather than using a fleet average to allow the flexibility that vessels need to deal with normal incidents beyond their control, this rule sets up a complicated and limited number of passes each year through VIEs and TIEs. The VIEs and TIEs are also provided for just one port, even if vessels call 3 different terminals - for instance in SD-LA/LB-SF - severely limiting their number, availability or usefulness. The VIEs and TIEs system is most punitive to vessels making fewer calls and those without an option to use alternative compliance options. The VIEs and TIEs are then dropped by 2029. As noted, this system is unrealistic and uncertain, leaving ships without knowing if they have incurred a violation or if they are in non-compliance, even if it is the result of something beyond their control.

**Limited Exceptions and No Alternative Compliance Option for Cruise Vessels:** The fact that there are no existing approved alternative compliance technologies that can be used by the cruise lines leaves cruise vessels at a major disadvantage in attempting to comply with this at berth rule. Without fleet averaging, and without the ability of the vessel itself to determine compliance with many requirements in this regulation because they must rely on CARB to make a separate decision after the ship has left port, the regulation leaves compliance completely uncertain for extended periods of time. This is a major flaw in this regulation.

**Remediation Fund Use:** This remediation fund would apply only to vessels that already have complied with the rule by installing on-board shore power technology, or that are using an alternative if a vessel can use an alternative, for circumstances beyond the control of the vessel operator. Vessels won't know for up to 30 days after requested if such request to use the fund is granted by CARB, and ineligible requests to use the remediation fund for a vessel visit will result in that visit being considered non-compliant with this regulation. Why should vessels be in violation of, or non-compliance with, a regulation under the listed scenarios that, as a practical matter, cannot be controlled 100% of the time - particularly if they will not know their compliance status until they have left port? The reality is that companies will not "plan to be non-compliant" as that would surely subject them to a violation. These issues are of concern to cruise vessels because they cannot use the existing approved alternative compliance options. The criteria for vessels to qualify for the remediation fund, like the VIEs and TIEs, should be clearly stated to allow the vessels to know at the time a problem arises that they either can or cannot use the fund.

**Remediation Fund Hourly Amount:** The regulation continues to require extremely high remediation fees, even though shorepower is already installed on the ships. The fee will be assessed on a per hour rate when many of the scenarios cannot be resolved within hours or days, but rather months. This is extremely punitive for an equipment part that is not available quickly, for instance. It is particularly punishing for large cruise ships which are subject to the highest \$12,000 per hour fee since they have no alternative compliance measure identified by CARB that will work on a cruise ship. At \$12,000 per hour, if an equipment part takes 3 months to obtain, the fee for cruise ships could be in the millions. The methodology for these charges should be revised to be fairer among various vessel types, and longer-term issues should be assessed at lower rates. Without these changes, the remediation fee acts not like a fair alternative emission control option, but rather a major penalty that is usually reserved for willful or intentional violations.

**Compatible Shorepower Berth Definition for Side of Ship Where Connection is Available:** CLIA appreciates that the regulation has been amended to clarify that the terminal is responsible for ensuring that shorepower vessels can plug into shorepower in a berth or position that will accommodate the on-board shorepower connection on the side of the ship that the connection is installed.

**Terminal and Port Plans and Interim Evaluation:** CLIA has no objection to the terminal and port plans specifically, however we still have a major problem with the timing of these plans and the complete lack of compliance dates for the terminals to actually comply with the components of the plan so that vessels can hook up as intended by the

rule. Vessels, however, must actually plug in or use the alternative for each visit to a berth by January 1, 2021. This is a complete disconnect between the timeline for vessels to comply with the rule and the timeline for terminals and ports to provide the infrastructure to the vessels to make sure they can plug in. A set implementation date should be established for the terminals and ports to provide the shorepower infrastructure for each vessel visit and the compliance timeline for the vessels should match that date. Just relying on TIEs if infrastructure at the terminals is not available will not remedy this issue. Do the ports feel confident that they have enough infrastructure to meet the requirements for currently regulated vessels and berth them on the correct side of the ships now and after additional vessel types are added?

**Compliance for Low Activity Terminals:** This regulation will require low activity ports that receive 20 or more visits per year for two consecutive years to begin compliance with this regulation. Cruise lines visit several of these low activity terminals and are concerned that a small terminal or port will not be able to gear up that quickly to provide power and install shorepower.

**Ongoing Timing Concerns:** This draft does not include dates by which a number of key requirements either must be approved by CARB or implemented, leaving vessels without the ability to determine compliance for an uncertain amount of time. That is not a fair process for ships that have been in compliance with the previous regulation since 2014. For instance, in addition to no final date by which the port and terminal plans must be implemented and infrastructure in place, there is no date by which CARB is required to review, audit and approve the checklist report or approve a request for a second or subsequent commissioning to qualify for an exemption; there is no guaranteed date by which online reporting will be available; there is no deadline by which CARB must notify entities regarding the opportunity to administer the remediation fund; and the remediation fund administrator may take months to get organized and operational, leaving the use of the fund unavailable for vessels to use as a compliance option in the interim.

**Liability:** The regulation adds a requirement at the end of the draft that “all responsible parties may be held jointly and severally liable for violating this Control Measure”. This should be clarified to be consistent with the liability/responsibility for ports, terminals, vessels and alternative compliance operators laid out in Table 6 and 7. Otherwise, it appears that all parties are liable no matter what the circumstances, which is in conflict with many other sections of the draft regulation.

Sincerely,

Donald Brown - VP, Maritime Policy  
Cruise Lines International Association

## Comment 63 for To Consider Proposed Control Measure for Ocean-Going Vessels At Berth (ogvatberth2019) - 15-1.

First Name: Fred  
Last Name: Hottinger

Subject: Proposed Control Measure for Ocean-Going Vessels At Berth  
Comment:

Please allow me to suggest a careful read of the attached articles from the NYT on 3/28/2020 and from the HuffPost on 3/31/2020 and then, in the light of this, please explain to the residents in the Columbia district of San Diego why the Port of San Diego still allows the deadly pollution from cruise ships, ferry boats and excursion boats to go on.

I am a resident of downtown San Diego, along with 40,000 other people. The cruise ships dock extremely close to our high-density residential neighborhood and the pollution caused when the ships are not connected to shore power is toxic. The ships contaminate the whole downtown, but are especially dangerous for residents in the half-mile radius of the terminal, including the high-density populations of Columbia, Marina and Little Italy Districts, with high-rise condominiums, apartment complexes and hotels. Over 1400 hotel rooms are across the street from the ships and many residents are literally one block from the cruise ship terminal, a distance of about 800 ft.

I don't believe CARB is considering the proximity of the ships to the residential population in its rule making. A one size fits all scenario for rule-making does not work since the health and welfare of thousands of people is being put at risk. The San Diego cruise ship terminal is very different than Los Angeles/Long Beach's and should be treated differently.

1. We are pleased that ships in fleets will be required to connect to shore power Jan 1, 2021. I want ALL cruise ships to meet this requirement, no exceptions, at the San Diego cruise ship terminal. Cruise lines already had years to convert their ships. If they want to dock in San Diego they should not pollute the neighborhood and people's lungs and homes.
2. Maintain the current timeframe standards, or make them tougher, to connect to shore power. One hour after the ship docks to berth is acceptable. Changing this connection time to 2 hours after Ready to Work, in our situation, is unacceptable. Vessels and the Port need to make sure that the connections are maintained and labor is available to connect in one (1) hour. Please do not lower standards by allowing two(2) hours or more to connect to shore power. After all, when ships come in at speeds of 7-12 kn and with long prior notification of & permission from the Port of San Diego
3. San Diego's Port Authority allows cruise ships to re-start their engines 1/2 hour before leaving the berth. We want that to

continue. A one hour timeframe to pollute is not necessary. Every hour the cruise ships are allowed to pollute downtown puts our health at increased risk.

4. In order for the Port of San Diego to meet the connection requirements already proposed, it needs money to build the additional infrastructure to provide a second connection to shore power. Please provide the resources to make this happen for the Port's readiness by Jan 1, 2021.

Sincerely,  
Fred Hottinger  
Vice President Sapphire Tower Home Owner Association

# Now Is the Time to Take Care of Your Lungs. Here's How.

By Zoë Schlanger March 27, 2020

A doctor examined a C.T. scan in a temporary coronavirus hospital in Wuhan, China, this month. Agence France-Press — Getty Images

If you are one of the millions of Americans breathing polluted air, you may be at a greater risk of catching the coronavirus and of having a more severe infection.

The reasons are twofold. First, air pollution can cause or aggravate respiratory illnesses like asthma or chronic obstructive pulmonary disease. And those illnesses can make you [more susceptible to the worst effects of](#)

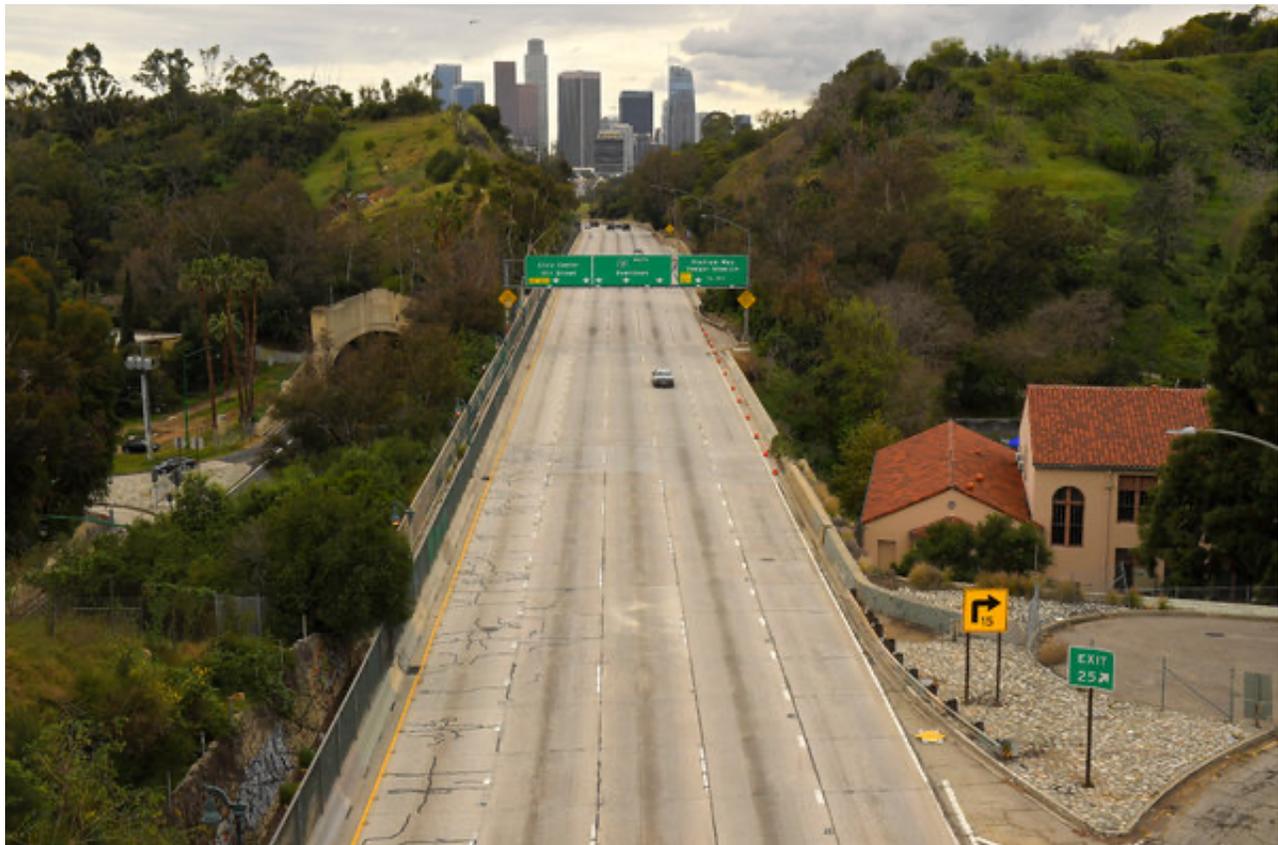

63-1

[lung infections](#). Second, exposure to air pollution is known to raise the chance of contracting viruses in the first place, regardless of underlying health conditions.

“Increased pollution increases susceptibility to infection,” said Dr. Meredith McCormack, a spokeswoman for the American Lung Association and associate professor of pulmonary and critical care at Johns Hopkins University. “All things being equal, a person exposed to air pollution would likely have a worse outcome if they were exposed to coronavirus.”

63-1  
cont.

Air pollution has dropped off sharply in many parts of the world recently, as businesses shut down and people stay home to avoid spreading the virus. Dr. McCormack said that was great for reducing hospitalizations from acute exposure to bad air, which can happen when a region’s pollution levels suddenly spikes.

## [Traffic and Pollution Plummet as U.S. Cities Shut Down for Coronavirus](#)

[A satellite that detects pollution linked to cars and trucks shows declines over major metropolitan areas, including Los Angeles, Seattle, and New York.](#)

But, she noted, “even in the setting of this pandemic, there will still remain areas of high exposure.” Power plants and refineries, for example, are considered essential and are unlikely to close. Moreover, even if pollution is down for now, chronic exposure can’t be mended so quickly. For a person living with daily pollution exposure, the damage to their respiratory and immune system is done.

Exposure to chronic air pollution is often linked to race and poverty. In the United States, people of color are much more likely to live in a place with poor air quality. And [toxic pollution sites are usually close to low-income neighborhoods](#). Around 18 million people whose incomes meet the federal definition for poverty [live in areas with some of the worst air quality in the country](#).

That’s the bad news. The good news is, while exposure to outdoor air pollution is often out of our hands, that’s less true of indoor air pollution. And, even though you might not expect it, indoor air can sometimes be worse than outdoor air.

Now that many of us are cooped up at home, indoor air quality is even more important.

Dr. McCormack, who is currently treating patients with Covid-19, stressed the importance of avoiding secondhand smoke indoors — and if you smoke, trying to quit.

"If you have a smoker in the home the particulate matter could be much higher indoors than outdoors," she said. If you smoke and you can't quit, do everything you can to avoid exposing other people to your smoke, like stepping outside. The same goes for people who vape.

Sign up to receive our daily **Coronavirus Briefing**, an informed guide with the latest developments and expert advice.

Frying foods or cooking without good ventilation can also increase indoor air pollution. Nitrogen oxides from gas stoves are a known respiratory irritant, as is the fine particulate matter that is [most likely wafting off your roasts](#). You should turn on the ventilation hood above your stove and open windows if you can.

One caveat: For people living in proximity to major sources of pollution, opening a window might not be a good idea. That's where an air purifier might be worth the investment if you can afford it.

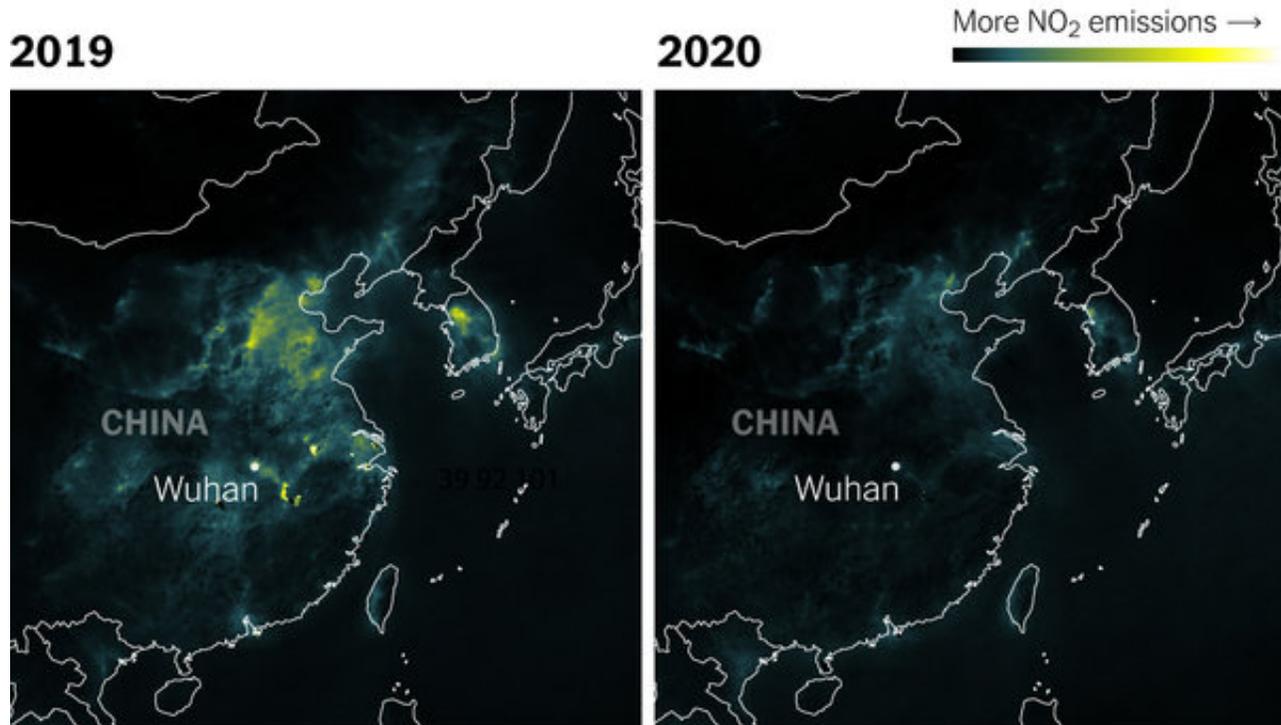

It's important to think about allergens, too. If you smell anything musty around your home, you should investigate. "Mold aggravates asthma," Dr. McCormack said. "This might be the time to address a damp spot or water damage problems."

This might also be the time to pest-proof your home. Mice and cockroaches can provoke asthma. Dr. McCormack suggested filling cracks around the house that might let in pests and taking care to properly store food that might entice them.

Finally, if you're taking maintenance medication for asthma, like an inhaler, don't forget to use it. "Remembering to take it can be challenging, particularly at a time like this when we aren't in the same routines," Dr. McCormack said. But it's an important step to protect yourself, particularly

now.

“With indoor pollution, we have a lot of control over more aspects of our exposure,” Dr. McCormack said. “In addition to a source of risk, it’s a source of opportunity. It’s a good time to change habits.”

## [Watch the Footprint of Coronavirus Spread Across Countries](#)

Sacramento, California 95812  
[cotb@arb.ca.gov](mailto:cotb@arb.ca.gov)  
[https://www.arb.ca.gov/lispub/comm/bcsubform.php?listname=ogvatberth2019&comm\\_period=A](https://www.arb.ca.gov/lispub/comm/bcsubform.php?listname=ogvatberth2019&comm_period=A)

**Subject: Industry Coalition Comments on the Supplemental 15-Day Notice, including the Initial Statement of Reasons, Environmental Assessment, Standardized Regulatory Impact Analysis, and Supporting Regulatory Documents**

Thank you for the opportunity to comment on the proposed At Berth Regulation. This coalition of industry stakeholders appreciates the opportunity to work with California Air Resources Board (CARB) staff during the course of this regulatory development on behalf of our ocean carrier, marine terminal operator, and other maritime industry member companies.

However, we are concerned that this rulemaking process is proceeding in the midst of a global crisis as our member companies are engaged in responding to the COVID-19 crisis by developing and *implementing* emergency procedures to address active coronavirus cases and prevent further infections, ensuring that their staff and communities are safe, and maintaining the supply chains that allow the U.S. and international response efforts to be executed and our communities to successfully shelter-in-place. As a result, their ability to review, understand, and comment on proposed regulations is severely constrained. CARB's indifference to meaningful stakeholder engagement is disappointing, particularly in the midst of a crisis. This coalition previously reached out to California Air Resources Board (CARB) and Cal/EPA outlining the impacts of the crisis on our industries (Attachment A) and the need for a pause in rulemaking during this crisis. Unfortunately, no response was ever received.

**Vastly Different Economic Circumstances**

The scale of the current crisis is unprecedented. As discussed in the analysis from Capitol Matrix (Attachment B), every key economic assumption in the CARB estimate of the proposed regulation has been dramatically affected by COVID-19 and the ensuing shelter-in-place orders. IHS Markit economists over the course of one week in March lowered their projection for 2020 US real GDP growth from a decline of 1.7 percent to a decline of 5.4 percent.<sup>1</sup> The impact to the maritime industry is even larger.

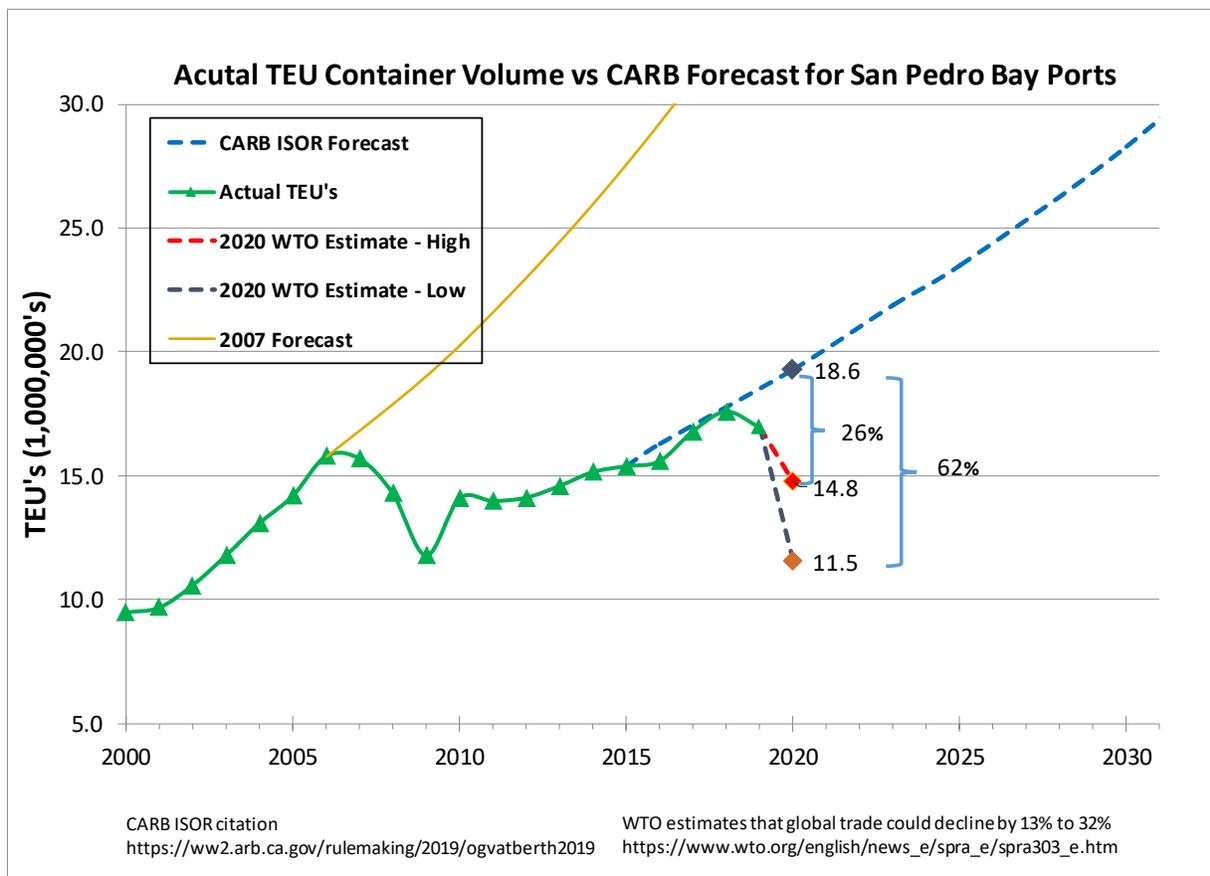

---

<sup>1</sup> [https://www.joc.com/maritime-news/container-lines/container-industry-fallout-coronavirus-linger-2021\\_20200407.html](https://www.joc.com/maritime-news/container-lines/container-industry-fallout-coronavirus-linger-2021_20200407.html)

The World Trade Organization (WTO) has estimated that global trade could decline up to 32% this year.<sup>2</sup> As a result of this crisis, the analyses on which this rule is based are out of date and no longer valid.

*Containerships*

According to SeaIntelligence, 435 sailings have been eliminated globally due to the COVID-19 crisis, with around 20% of trans-Pacific sailings blanked for much of the second quarter.<sup>3</sup> The ISOR analysis is predicated on strong growth assumptions based on a number of forecasts. Questions about those assumptions were raised prior to the current crisis. For example, the ISOR analysis assumes that from 2016 (the inventory base year) through 2020 cargo at the ports of Long Beach and Los Angeles would grow 4.5% per year. Last year (before the current crisis), the two ports declined 3.3%. Since the crisis, the decline has accelerated, with year-over-year declines in January (-5.1%), February (-16.9%), and March (-19.7%). Before even considering the rest of the year, the current crisis means the emissions inventory contained in the ISOR is wrong. That gap only grows if the rest of 2020 is forecast based on WTO projections as shown in the figure below.

<sup>2</sup> [https://www.wto.org/english/news\\_e/spra\\_e/spra303\\_e.htm](https://www.wto.org/english/news_e/spra_e/spra303_e.htm)

<sup>3</sup> <https://www.seatrade-maritime.com/containers/container-line-blank-sailings-increase-435>

By the end of this year, the baseline forecast used in the ISOR will overestimate cargo volumes by between 26% and 62%. While it would be nice to claim that this cargo disruption is unprecedented and that cargo volumes will quickly return to normal, there is historic precedent that we are facing a long climb out. Prior to the Financial Crisis, the 2007 Forecast estimated that cargo volumes would grow to 65 million TEU by 2030. Following the decline from the last recession, cargo volumes never recovered to their pre-recession levels of growth (see chart above). Similarly, the impact of the crisis is also not likely to be short-lived. A new McKinsey study estimates that recovery in the USA could take until 2023.<sup>4</sup> With each year, the gap between the ISOR forecast and reality will grow larger, further distorting the analyses predicated on the forecast. Whatever the next decade holds for cargo growth, the only thing that is certain is that it is not represented by the strong growth forecast contained in the ISOR.

The estimates of benefits, emissions estimates, costs, cost-effectiveness, and health impacts, which presume the rate of growth contained in the ISOR, are now no longer valid. Even if growth were to immediately resume at levels assumed in the ISOR, cargo volumes and resulting activity will likely be millions of containers off from the cargo volume estimate.

68-1

#### *Cruise Ships*

The economic impact of COVID-19 on the cruise industry is substantial. The suspension of operations will have a pronounced detrimental impact on families and communities globally. Of the 421,000 industry supported jobs in the United States, 12% are in California, yielding 49,369 jobs in The Golden State and generating \$3.26 billion in total wages and salaries.

The cruise industry is vital to California's economy. The major ports of Los Angeles, Long Beach, San Diego, and San Francisco host millions of passengers and crew, producing direct onshore spending and contributing \$2.5 billion annually to the state of California.

While suspending operations is critical for the health and safety of passengers and crew amid the COVID-19 pandemic, the impact on the economy is extensive. When the voluntary suspension was announced in mid-March to cease operations until mid - April, the jobs of 3,159 Californians were lost, amounting to \$163 million in wages and \$185 million in direct spending. Nearly 70 jobs in California are lost each day the cruise industry remains in suspension of operations. If the suspension continues through June, the loss of direct spending will be \$427 million and a stifling loss of 7,557 jobs, amounting to a \$391 million loss in wages.

#### *Tankers*

In a similar fashion, fuel consumption has precipitously declined as a result of the crisis. With an unprecedented number of people filing jobless claims that need and demand for fuel has plummeted. The U.S. Energy Information Agency showed a significant drop in demand in gross refinery inputs in its latest Weekly Petroleum Status Report<sup>5</sup>, as presented in the graph below. Refinery demand will directly impact demand for liquid bulk vessels calling California ports. How fuel demand will recover following

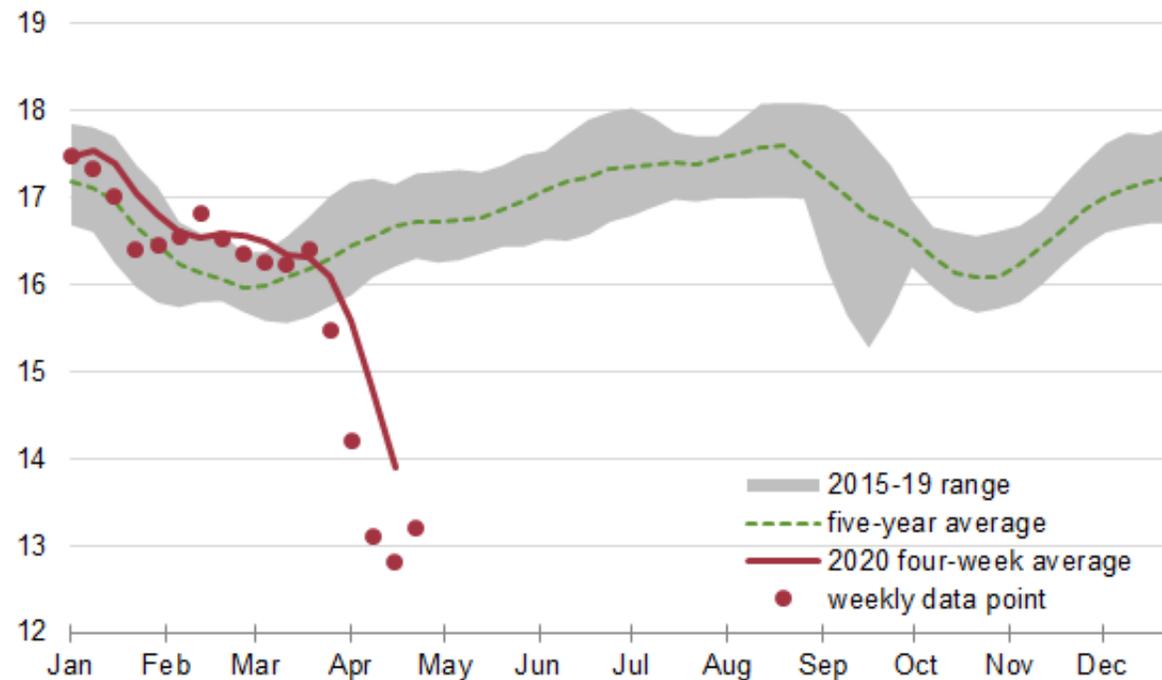

<sup>4</sup><https://www.mckinsey.com/~media/mckinsey/business%20functions/risk/our%20insights/covid%2019%20implications%20for%20business/covid%2019%20march%2025/covid-19-facts-and-insights-march-25-v3.ashx>

<sup>5</sup> [https://www.eia.gov/petroleum/weekly/archive/2020/200429/includes/analysis\\_print.php](https://www.eia.gov/petroleum/weekly/archive/2020/200429/includes/analysis_print.php)

the crisis and whether there will be fundamental shifts in transportation and fuel consumption is unknown at this time. Again, it is clear that the forecasts contained in the ISOR no longer represent a reasonable expectation of future activity of tankers in California. New analysis is necessary to determine how future demand for liquid bulk imports will change as a result of the COVID-19 crisis.

**Figure 1. U.S. gross refinery inputs**

million barrels per day

Source: U.S. Energy Information Administration, *Weekly Petroleum Status Report*

#### Ro/Ros

The crisis is also forecast to impact auto sales in this country and globally. Decreased auto sales will translate into reduced Ro/Ro activity. A forecast by Automotive from Ultima Media<sup>6</sup> indicates that it will take most of this decade for auto sales to return to their pre-crisis levels. The base case scenario has volumes declining from 2019 by 14%. In a worst-case scenario, volume declines would plunge 28% from 2019 levels.

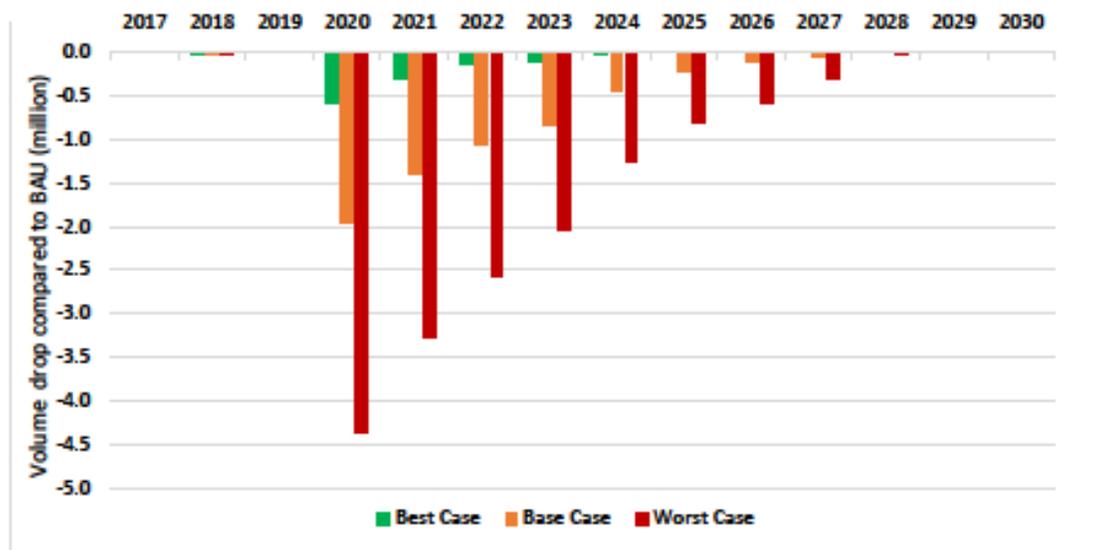

<sup>6</sup> <https://www.automotivemanufacturingsolutions.com/insight/global-vehicle-demand-forecast-2020-2030-the-drastic-impact-of-the-coronavirus-crisis/40396.article>

**US Automotive Sales Volume Forecast Under 3 Scenarios 2017-2030 (units)**

Source: Automotive from Ultima Media

**US Automotive Sales Volume Drop Compared to BAU Under 3 Scenarios 2017-2030 (units)**

Source: Automotive from Ultima Media

As was the case for other vessel categories, the forecast upon which the Ro/Ro analysis was conducted is no longer valid. While the Automotive from Ultima Media forecast slightly growing by the end of the decade, the proposed rule is based on a growth rate that would see Ro/Ro activity 83.5% higher than

2016 levels in the ports Los Angeles and Long Beach by 2030 and 31.9% higher at the Port of Hueneme<sup>7</sup>. These numbers are not realistic or a reasonably foreseeable outcome of the current economic climate.

The ISOR must be revised to take these significant effects into account. California is already responding to the economic reality in other arms of the government. On April 10, the California Department of Finance (DOF) sent a budget letter to the Legislature alerting them to the dramatic impact that the COVID-19 pandemic is having on the California economy and state budget<sup>8</sup>. In the letter, DOF indicated that the effects of the downturn will be felt immediately, that the California unemployment rate could peak at a rate higher than the Great Recession of 2008, and that economic softness could persist into 2020-21 and additional years depending on the pace of recovery to local, state, and national economies. It referenced a multi-year recession alternative included in its January budget, and indicated that actual increases in unemployment would be much larger.

California's Legislative Analyst's Office (LAO) acknowledged the scope of the economic change that the State is witnessing<sup>9</sup>. In a document titled "Preliminary Assessment of the Economic Impact of COVID-19" released on April 16, 2020, the LAO declared that "Job Loss and Abrupt Halting of Economic Activity Make It Clear That We Have Entered a Recession". This assessment was initially confirmed with news reports of 1<sup>st</sup> Quarter GDP results<sup>10</sup>.

### **Correct the Projections and Analyses**

First, CARB should pause the rulemaking and begin working with the port authorities to develop new cargo volume and cruise visits projections that will serve as the basis for re-analysis of the proposed rule. Second, CARB should revise its assumptions based on the comments previously submitted by stakeholders that demonstrate costs have been underestimated and emission reductions and health benefits have been overestimated. Finally, CARB should re-evaluate baseline emissions, proposed emission reductions, health benefits, costs, and cost-effectiveness based on a revised forecast and assumptions.

68-2

### **Previous Comments Unaddressed**

The industry coalition is concerned that our comments on the ISOR were not addressed or considered. Extensive technical comments on cost, infrastructure, and feasibility were submitted with supporting information. In fact, some of the proposed "15-Day Changes" are diametrically opposed to the evidence submitted to CARB. As an example, substantial evidence, in the form of engineering analysis and previous comparable examples, was submitted by both industry and port authorities demonstrating that more time was needed to ensure successful compliance with the rule. Those concerns and that evidence appears to have been dismissed, with CARB staff proposing to accelerate already unachievable timelines. Accordingly, we request that CARB staff review and respond to all industry comments prior to Board consideration of the proposed regulation.

<sup>10</sup> <https://www.latimes.com/politics/story/2020-04-29/u-s-economy-in-clear-sign-of-recession-shrinks-4-8-in-first-quarter-due-to-coronavirus>

### **Proposed Changes Are Not Consistent with “15-Day Change” Requirements**

Accelerating deadlines in the rule by 33% for tankers and 25% for Ro/Ros with no evidence to support the feasibility of the proposal is not a reasonably foreseeable change to the proposed regulation. As a result, these changes are not appropriate for a “15-Day Change” notice. The changes substantially alter the impact and implementation of the proposed rule. CARB staff should recirculate the proposed changes as a “30-Day Change” notice.

The purpose of the “15-Day Change” notice is to provide flexibility for *de minimis* changes that do not require substantial new analysis. The proposed changes have required concurrent changes to every element of the analysis: costs, emissions inventory, and health benefits. Even worse, the impact of an accelerated schedule on costs are not disclosed, eliminating the opportunity for stakeholders to provide comment on the change.

### **Increased Costs Not Disclosed**

Accelerating the schedule increases costs in multiple ways. However, the “15-Day Change” notice provides no detail on how costs increased. There is only a vague statement that total program costs have increased by \$210 million. It attributes increased costs to the accelerated schedule and to the inclusion of the Innovative Concept section but does not identify what those costs are or how they arise. The nature and mix of costs are important to understanding the economic impact. As the Department of Finance (DOF) pointed out in its comment of the Standardized Regulatory Impact Assessment (SRIA):

“the SRIA must include non-annualized capital costs. Capital costs are almost half of the direct costs of the package. However, because new facilities are required for compliance, these capital costs may not be spread evenly across the effective period of the regulation as ARB assumes, but will depend on the ability of parties to finance up-front costs. The SRIA should disclose the cost of capital construction to the year the money will actually be spent, as well as the assumed amortization.”

The proposed acceleration of the deadline compounds the issue that DOF identified. Without detailed information on the increased costs, it is impossible to assess and provide impacts for those increased costs.

### **Innovative Concepts**

Another major proposed change would allow the use of certain “Innovative Concepts” (IC) to meet compliance obligations. CARB staff present the “Innovative Concepts” provisions as an alternative compliance pathway but the proposal would fail to serve that purpose as currently written. A number of changes are necessary in order for the IC section to be workable.

- A fleet averaging concept should be a defined path within the IC section. Fleet averaging, as a program whose parameters are known, should not be subject to the unnecessary restrictions for new concepts. Given the known success of fleet averaging to reduce emissions, it is not

necessary to create uncertainty by having a three-year term with extension subject to uncertain approval.

- There should not be a set term for IC plans. As written, the IC section requires regulated parties to repeatedly apply for and receive CARB approval to use an “Innovative Concept” for limited three-year terms. Different concepts may require different terms in order to recoup any necessary investment. A one-size-fits-all approach is unwarranted and unnecessary. The term for any IC can be determined individually.
- While IC must be “surplus” at the time of creation, CARB could revoke or decline to renew approval if the emission reduction became subject to regulation at a future date or by any CARB-approved AB 617 Community Emission Reduction Plan. The IC section should be modified to recognize IC reductions without this limitation.
- Limiting the location of IC emissions reductions only to “adjacent” communities and distances no greater than 3 nautical miles may have unintended consequences. Neither “adjacent” nor “community” are defined in the Proposed Regulation, so it is unclear how close an area would need to be in order to be deemed “adjacent,” and where the boundaries of that area would end. The IC section should be modified to encourage any project (adjacent or not) that would benefit the port and terminal communities.
- The IC section sets a deadline for submitting a proposal. This implies that IC will not be considered after 2021. We do not believe it was the intention of staff to limit development of IC to the first six to twelve months of the proposed rule’s implementation. The deadline should be removed and replaced with the process for IC plan review at any date such plans are submitted in the future.
- The prohibition on public funding for ICs is too broad. Funding may come from different sources, including federal, other states, or other nations. In addition, such a prohibition would exclude demonstration projects. Fleets that are likely to engage in ICs, including fleet averaging, are also likely to participate in demonstration projects sought by CARB or other air quality agencies. Being innovative should not prohibit technology advancement.
- The requirement that “if no environmental review is determined to be required by a local lead agency, the applicant must submit documentation from the local lead agency explaining environmental review is not required” does not make sense in the context of the California Environmental Quality Act (CEQA). It is not normal for an agency to affirmatively state it is not taking action under CEQA; it simply does not act. The environmental review provision should be limited to the review of CARB’s action, if any. If CARB determines environmental review is necessary, it must conduct that review unless another lead agency is identified. CEQA already contains provisions for addressing conflicts between multiple lead agencies. If CARB determines that its action does not require environmental review, it is not necessary to determine if other lead agencies may exist.

- Revocation of the IC plan provides for a 30-day notice. This is likely to be inadequate for an ocean carrier to transition to original provisions of the rule. The risk of a 30-day transition at the uncertain end of a three-year program is enough to prevent an ocean carrier opting to implement an IC. The IC section should include a nine-month transition period upon revocation of an IC plan.

### **Accelerated Deadlines are Unachievable**

As was demonstrated in multiple industry comment letters, the original deadlines were unachievable. The rule demonstrated this absurdity by requiring facility plans to ensure compliance six months after compliance is required. The only engineering analysis in the record was submitted by the ports of Long Beach and Los Angeles that demonstrated, based on actual past experience, that more time was necessary to implement the proposed rule. No engineering analysis was conducted by CARB and no information has been made part of the record to support the accelerated deadlines. The accelerated deadlines for tanker and Ro/Ro vessels cannot be achieved.

### **LCFS Considerations**

The economic analysis presented by CARB shows Low Carbon Fuel Standard (LCFS) credit-derived revenue offsetting electricity, labor, and infrastructure costs without restriction. At the time of this letter, CARB LCFS staff is still preparing guidance on the "Use of Proceeds" under the LCFS regulation. As a result, it has not been clear what costs are eligible for offsets on the LCFS "Use of Proceeds" requirements. Please confirm that shore power-related electricity, labor, and infrastructure costs are eligible offsets for shore power-generated LCFS credit revenue.

### **Summary of Proposed 15-Day Changes and Impacts on Costs Inconsistent with Proposed Regulation**

The summary of the impacts on costs states that emission reductions can be achieved for \$30,000 per weighted ton and the cost analysis for the proposed regulation has been updated to reflect that cost assumption based on information from PMSA and WSPA. The referenced PMSA email concerned the appropriate value of the remediation fund since the purpose of the remediation fund is to replace unmitigated auxiliary engine emissions. If CARB staff believes that number accurately reflects the costs to offset uncontrolled emissions, the hourly remediation fund rate should be adjusted to reflect that. If CARB does not believe that the \$30,000 per weighted ton estimates of cost reflect the cost of replacement emission reductions, then the cost estimate prepared by CARB should reflect the higher value used to establish the remediation fund rate. CARB should not select higher and lower costs in order to achieve a preferred outcome depending on each situation.

### **Fundamental Problems with Emissions Inventory Unresolved**

Even before addressing the changes brought about by the COVID-19 crisis, the emissions inventory has not addressed known problems as described in previous industry stakeholder comment letters. The inventory overestimates growth, resulting in a significant overestimation of the proposed rule's emissions benefit. The inventory does not consider the emission reductions associated with Proposition 1B funding requiring emission reductions of 90% under the existing rule – 10% more than the proposed

rule. This results in the inappropriate attribution of emission reductions from existing requirements to the proposed rule. The emissions inventory also inappropriately caps emission reductions under the existing rule at 80%. Every vessel with a call greater than 15 hours will result in emission reductions greater than 80%. In San Pedro Bay, where calls greater than 100 hours are typical, emission reductions can exceed 97%. Yet, no reason is given in the emissions inventory for capping emission reductions. The inventory must be updated to reflect these issues.

CARB inventory staff have acknowledged these issues in a variety of phone calls and emails with stakeholders and have indicated that these issues will be resolved sometime this summer. That does a disservice to both the public and decisionmakers in understanding the benefits of the proposed rule changes.

**Additional CEQA/EA Considerations**

In addition to the previous issues described in this letter that require additional evaluation under the California Environmental Quality Act (CEQA), the changes to the proposed regulation will result in the need for revised environmental assessments. Among the proposed changes, the lead time for tankers will be reduced by 33% and for Ro/Ros by 25%. These changes represent significant new information and a substantial change to the project description that triggers the recirculation of the environmental assessment under CEQA. In addition, by accelerating the deadlines, more infrastructure work will be required over a shorter period of time. A foreseeable consequence is that overlapping construction will lead to higher peak emissions. The California Environmental Quality Act (CEQA) requires that these changes be evaluated.

68-4

The COVID-19 crisis and its impact on future cargo volumes, emissions, and benefits of the proposed regulation also represents significant new information requiring review, analysis, and recirculation of the environmental assessment. As described earlier, forecasts used in the analysis of the proposed regulation may overestimate activity by 62% by the end of this year alone! The environmental assessment must be revised to reflect this new reality.

**Timed Connection Requirement**

CARB staff has revised the one-hour limit on the connect and disconnect times for shore power to a two-hour connect time limit and one-hour disconnect time limit. While it is appreciated that the infeasibility of the one-hour requirement was acknowledged, a two-hour requirement is still arbitrary and capricious and not based on any evidence that it is safe or feasible. As we have said in previous letters, the existing rule permits multiple connection strategies, some of which will require more than one hour. More importantly, the shore power connection process requires individual people to manhandle heavy, high-voltage equipment and energize that equipment – sometimes in adverse weather conditions. Under no circumstances should that work be performed under a stopwatch. The two-hour requirement would likely be ineffective because any exceedance of the one-hour requirement would likely result in a safety exemption being sought, as having labor move faster handling high voltage equipment would be fundamentally unsafe.

CARB staff has still provided no basis on which it can be assumed that connection times can be consistently and safely accelerated. In fact, no data is available from CARB justifying the previous one-hour connection window or the new two-hour connection window.

**Reporting for Bulk Vessels Should Be Eliminated**

The reporting requirements for general cargo and bulk vessels add a real, quantifiable burden to bulk and general cargo vessel operators, but do not advance any emissions reduction program in California. The State should not impose costly reporting requirements for the sole sake of collecting more information, particularly when there is no planned use for that data. If CARB identifies a future need for such data, it is readily available through alternative sources such as marine exchanges or port authorities. There are even existing regulatory tools in place like the OGV fuel rule that CARB can use to obtain vessel information and ensure significant emission reductions. There is no reasonable basis to place a permanent, costly reporting burden for no measurable or identified benefit.

Sincerely,

Attachment A:  
Industry Coalition Letter  
Impact of COVID-19 on At-Berth Regulatory Schedule  
March 20, 2020

March 20, 2020

Jared Blumenfeld, Secretary  
California Environmental Protection Agency  
1001 I Street  
Sacramento, California 95812

Mary Nichols, Chair  
California Air Resources Board  
1001 I Street  
Sacramento, CA 95812

**Subject: Impact of COVID-19 on At-Berth Regulatory Schedule**

Dear Secretary Blumenfeld and Chair Nichols:

The spread of COVID-19 is disrupting the entire world. The impact has been particularly difficult to manage in an industry based upon the international movement of goods and people. Necessary precautions to address COVID-19 have already made compliance with the existing At-Berth Rule difficult and, at times, impossible. Travel bans and self-quarantines have already kept key personnel from reaching vessels and terminals. Many vessel sailings were cancelled from China and vessel schedule will take months to restabilize. Here in the United States, while we are still in the early stages of the spread of this disease, industry has already documented to your staff the many instances of our inability to conduct routine maintenance, repairs, or vessel commissioning as a result of COVID-19 restrictions.

In addition to the challenges that this public health crisis poses to industry compliance with the existing shorepower regulation, we will also be impacted with respect to promulgation of a new proposed rule. We appreciate that your staff has already delayed the release of the 15-Day package for the At Berth amendments and is considering extending deadlines for comments. Unfortunately, that is not enough. Based on the recent study from Imperial College London, this outbreak will not subside for months with the peak in the United States not reached until June 2020. As a result of the extraordinary disruptions to normal business operations associated with this crisis, it will be impossible for the regulated community, spread across the world, already dealing with limitations with respect to our ability to comply with the current regulation to also participate in the rulemaking process for months.

With respect to implementation, it is unclear when personnel and vendors will be able to travel again to begin making necessary improvements to comply with the requirements of any amended rule. The proposed rule compliance date was already very aggressive, and our Coalition has consistently and repeatedly raised concerns that compliance was infeasible even under the best of circumstances due to the operational and infrastructure changes to be implemented.

As a result of the COVID-19 circumstances described above and in anticipation of other extenuating factors arising from this crisis that may come to light in the coming months, we respectfully request that the regulatory schedule be paused until January 2021 when this crisis is over and its full impacts have been assessed.

We look forward to continuing our good working partnerships and positive relationships with the Agency and the Air Resources Board during these trying times.

Sincerely,

**California Association of Port Authorities  
Pacific Merchant Shipping Association  
World Shipping Council**

**Cruise Lines International Association  
Western States Petroleum Association**

Attachment B:  
Capital Matrix Consulting Report  
April 27, 2020

April 27, 2020

Ms. Catherine Reheis-Boyd  
President  
Western States Petroleum Association  
1415 L Street, Suite 900  
Sacramento, CA 95814

Dear Ms. Reheis-Boyd:

This letter is in response to your request that our firm evaluate the effects of the COVID-19 pandemic on the estimates in the California Air Resources Board (CARB) Standardized Regulatory Impact Assessment (SRIA) of the *Ocean-Going Vessels at Berth* proposal, as modified by the “15-day changes” document released on March 26, 2020.

## **Background and Proposed Regulation**

The proposed regulation would expand the type and number of ships that must use shore electrical power or an alternate recapturing method to reduce emissions while at berth. Existing rules require most container ships, refrigerated ships and cruise ships to use shore power when docked in ports rather than run their auxiliary engines to create electricity for lighting, air conditioning or operation of shipboard equipment. Alternatively, these ships can continue to use auxiliary engines but then must connect to an on-shore or barge-based capture and control system. The current regulations are in place at six ports: Los Angeles, Long Beach, Oakland, San Diego, San Francisco and Hueneme.

Key provisions of the proposed regulation (as modified by the 15-day changes) would:

- Make smaller container, reefer and cruise ships subject to the shore power regulation. Those requirements would phase-in beginning in 2021.
- Make roll-on/roll-off (ro-ro) ships subject to the shore power regulation starting in 2024.
- Expand the requirement to include tankers beginning in 2025 at the Los Angeles and Long Beach terminals, and elsewhere in 2027. In addition to auxiliary engines, the proposal would require large tankers to reduce emissions from boilers used to power steam-driven pumps involved in offloading crude oil, unless shore power is installed.

- Expand the ports and terminals covered in the regulations. Ports, including refinery docks, in Northern California in or near cities such as Stockton, Richmond, Rodeo, Benicia and Martinez, would now be covered.
- Allow vessel and terminal operators to meet berth emission reduction requirements through an approved “innovative concept.” The concept, which according to CARB would most likely be used at smaller ports, allows vessel or terminal operators to achieve targeted emissions savings through an alternative project. These concepts would only qualify to the extent they are not required by regulation, including future regulations and AB617 Community Emission Reduction Plans.

## CARB Estimates of the Proposal’s Impact

CARB estimates that the proposed regulation would have the following impacts:

- A total net cost of \$2.40 billion for the period 2021 to 2032 and avoided adverse health outcomes worth \$2.44 billion for the same period.
- Unit costs of regulation in 2030 of \$1.30 per Twenty-Foot Equivalent Unit (TEU) for container or reefer vessels, \$5.25 per cruise passenger, \$7.49 per automobile moved on a ro-ro ship, and less than a penny per gallon of finished product for products moved by tanker.
- Net decreases in economic activity over the 2021 to 2032 period due to added regulatory costs and reduced productivity, offset in a few years by new construction activity.
  - By the final year of the projection period (2032), *decreases* of:
    - \$297 million in gross state product;
    - 2,385 jobs;
    - \$234 million in personal income; and
    - \$90 million in private investment.

## Methodology and Assumptions Behind CARB’s Estimate

**Methodology:** CARB’s estimates were based on a multiple-step process:

- Information was developed by CARB staff regarding such factors as costs of permitting, planning, engineering, construction, equipment, installation, and operations, and maintenance.
- These assumptions were then entered into a proprietary economic forecasting and policy analysis model licensed by REMI. The REMI model integrates input-output, computable general equilibrium, econometric, and economic geography methodologies to estimate the impacts of cost changes and other factors on the

broader economy. A basic feature of computable general equilibrium models is that their outputs are highly sensitive to changes in economic assumptions.

**Key assumptions.** The REMI economic model starts with a baseline set of economic assumptions that tie to the California Department of Finance (DOF) forecasts made in the Spring of 2019. At the time, DOF projected that U.S. and California economies would experience moderate but sustained economic growth through 2022, as follows:

- 1) Employment increasing by an average of 1 percent per year,
- 2) Personal income increasing by 4 percent per year, and
- 3) U.S. real gross domestic product increasing by 2 percent per year.

The May 2019 population projection indicated that California would add about 2.4 million people between 2019 and 2032.

Other inputs into CARB’s estimates included diesel price projections and “industry growth factors.” The diesel price projections were based on U.S. Energy Information Administration’s (EIA) October 2018 estimate, which assumed steady growth in diesel prices, from \$2.80 per gallon in 2019 to \$5.03 by 2032. The industry growth factors are intended to capture the impacts of expected growth in port volume over time. They are used by CARB for its baseline emissions estimates and most of its cost estimates. The growth factors are based on a combination of projections supplied by U.S. Federal Highway Administration’s Freight Analysis Framework (FAF) 65 and, where available, from individual ports. Using these estimates, CARB assumes growth factors of 77 percent for container vessels, 79 percent for cruise ships, 52 percent for ro-ro vessels, and 14 percent for tankers.

## Impact of COVID-19 On CARB’s Assumptions

Every key economic assumption in the CARB estimate of the proposed regulation has been dramatically affected by the COVID-19 pandemic. Fuel prices, economic output, jobs, international trade and waterborne port activity will all be sharply lower than anticipated in any economic forecast made prior to March of this year. Given the emerging expectation that recovery from the historic COVID-19-related downturn will be slow (see discussion below), we expect the economic measures will remain below the levels assumed in the CARB projections for several years to come. This will, in turn, have impacts on CARB’s estimates of (1) baseline emissions, (2) emissions reduction and health-related savings resulting from the proposal, (3) costs and savings to the ports, terminals, and vessel operators, and (4) broader economic impacts of the proposed regulation.

68-5

**Recent economic developments.** The COVID-19 pandemic has led to a global economic contraction that is more severe than the 2008-2010 Great Recession. Nationally, new claims for unemployment insurance totaled 26 million over the five weeks ending on April 23. Over the three weeks ending on the same date, California processed about 3.4 million unemployment claims. These claims represent about 17 percent of the U.S. and California

workforces, respectively. Turmoil in global oil markets have driven the price of West Texas Crude downward, to less than \$17 per barrel as of April 23, 2020.<sup>1</sup>

**Department of Finance comments.** On April 10, the California Department of Finance (DOF) sent a budget letter to the Legislature alerting them to the dramatic impact that the COVID-19 pandemic is having on the California economy and state budget. In the letter, DOF indicated that the effects of the downturn will be felt immediately, that the California unemployment rate could peak at a rate higher than the Great Recession of 2008, and that economic softness could persist into 2020-21 and additional years depending on the pace of recovery to local, state, and national economies. It referenced a multi-year recession alternative included in its January budget, and indicated that actual increases in unemployment would be much larger.

**Other recent forecasts.** Recent national economic forecasts show a similarly dark picture for the U.S. economy. On April 23, the Congressional Budget Office released its first post COVID-19 forecast, which showed a 5.6 percent decline in inflation-adjusted gross domestic product in 2020, followed by a subdued increase of 2.8 percent in 2021.<sup>2</sup> (For context, real GDP fell by a cumulative total of 2.6 percent in the first two years of the 2008-2010 recession, which was considered to be the most severe since the 1930s.) CBO's projected level of unemployment is 11.4 percent for 2020 and 10.1 percent in 2021. The primary reason that CBO's forecast anticipates only a modest rebound in 2021 is its expectation that social distancing will continue (albeit at a lesser rate) through the first half of 2021.

Other forecasts show equally sharp declines in 2020, and, under some scenarios, an extended period of subdued economic activity.<sup>3</sup> Factors that could result in long-term declines include permanent downsizing of some sectors and occupations due to such factors as reduced travel, changes in consumer spending patterns, workplace practices (e.g., more home-based workers, more reliance on technology, less travel), and shifts in global supply chains.

## Areas Where A Changing Economic Outlook Will Impact Estimates of the Proposed Regulation

Following are examples of areas where the weaker post COVID economic outlook will affect CARB's outdated estimates of the proposed regulation's impact.

**Less port activity under the baseline.** As noted earlier, the CARB estimates assume substantial growth in vessel visits through 2032. However, trade flows and port activity are

---

<sup>2</sup> "CBO's Current Projections of Output, Employment, and Interest Rates and a Preliminary Look at Federal Deficits for 2020 and 2021." Congressional Budget Office, April 24, 2020. <https://www.cbo.gov/publication/56335>.

<sup>3</sup> See for example, S&P Global Ratings, Economic Research: COVID-19 Deals A Larger, Longer Hit to Global GDP. <https://www.spglobal.com/ratings/en/research/articles/200416-economic-research-covid-19-deals-a-larger-longer-hit-to-global-gdp-11440500>

highly sensitive to changes in the state, national, and global economic environments.<sup>4</sup> Based on current economic realities, vessel activity will grow by considerably less than what was assumed in the SRIA. Beyond the general impacts of an economic recession on port volume, we believe it is possible, potentially likely, that the COVID pandemic will have lasting impacts on growth in cruise ship totals, further reducing port activity in the state.

The reduction in vessel activity will lower the level of baseline emissions, which in turn affects the amount of potential emission reductions and health benefits that can be realized from the regulation.

68-6

On the cost side, the methodology used by CARB scales the great majority of regulatory costs upward and downward in proportion to the size of the projected industry growth factor. Hence, we would expect reduced vessel activity to lower its estimate of regulatory costs. However, we note that not all of the costs associated with the proposed regulation will rise or fall in line with the industry growth factor. We would expect, for example, infrastructure-related costs to the terminals themselves to have both fixed and variable components. Because these fixed costs would be spread over fewer visits, a reduction in activity would *raise* per-vessel regulatory costs.<sup>5</sup>

**Cost shifting.** The SRIA analysis assumes that a significant share of the major costs associated with the land-based shore-power and capture and control systems will be initially be borne primarily by ports. However, the impact on ports is assumed to be lessened by two factors: (1) the major capital costs are annualized over a 20-year life for terminal equipment; and (2) some, perhaps most, of the costs will be shifted – from ports to terminal operators through lease increases, and from terminal operators to vessel owners and owners of discretionary cargo through rate increases. Thus, the ultimate incidence of the proposed regulation is assumed to be shared by entities around the world.

However, a couple of points are worth noting. First, the required infrastructure costs are not revenue-producing. Consequently, it is not possible to finance them through the traditional revenue-bonding mechanisms used by ports. While it may be reasonable to assume that some of the port authorities could handle the major expenses imposed by this proposal without reducing other expenditures during good economic times, the situation is markedly different when the economy is soft, even at the larger ports. Under such circumstances, regulatory costs are more likely to squeeze out other port projects that are potentially productivity-enhancing or emissions-reducing (at a more cost-effective rate).

Second, the impact on ports is magnified by the fact that it is more difficult to shift costs onto vessel owners and owners of discretionary cargo when these entities are facing their own financial hardships in a depressed economy. If a smaller portion of the regulation's

---

<sup>4</sup> As an example, cargo tonnage through the Port of Los Angeles grew by 50 percent between 2002 and 2007, but plunged 17 percent the following year, and did not return to the pre-recession level for a decade. Source: Tonnage Statistics/Port of Los Angeles. <https://www.portoflosangeles.org/business/statistics/tonnage-statistics>

<sup>5</sup> As noted in the on page 26 of SRIA report, "As terminal visit activity decreases, the cost effectiveness of installing emissions control equipment becomes worse, as there are fewer vessels calling at the terminal to use the equipment and to help recoup the costs of installing, operating, and maintaining the equipment."

costs are borne by discretionary cargoes and vessel visits, then a larger portion of those costs will necessarily be borne by Californians. In a growing market, it may be reasonable to assume that the cost-incidence of a proposed regulation will be shared broadly by cargo owners and consumers around the world. However, when markets are less robust, those costs will become more concentrated in this state.

**Fuel-related savings estimate.** CARB’s estimate of net costs incurred by vessel operators using port power includes vessel equipment and maintenance costs. But these costs are partly offset by fuel savings, since the vessels would no longer have to run their auxiliary engines when in port. The estimated amount of fuel savings is based on the marine gas-oil price of \$763/metric ton (actual cost in April 2019), adjusted using the U.S. Energy Information Administration’s (EIA) price projections for transportation diesel fuel. The EIA projection, made in October 2018, assumed that diesel prices would rise from \$2.80 per gallon in 2018 to \$3.39 in 2020, \$4.30 by 2025 and \$5.03 by 2030. (The same forecast assumed that West Texas crude oil would rise from \$50 per barrel in 2018 to \$72 per barrel by 2020, \$100 per barrel by 2025, and \$120 per barrel by 2030. As noted earlier, the price as of April 24 of this year was \$17 per barrel.) If lower crude-oil prices persist, the avoided costs will be substantially *less* than assumed in the CARB estimate, and net costs of the regulation will be *higher*.

**Competitiveness.** The SRIA indicates that the proposed regulation will increase costs to California ports and the vessels that visit them. It also indicates that it is not possible to determine the impact of the higher costs on cargo diversions. It asserts that studies exploring the relationship between general cost increases and cargo diversion have come to varying conclusions; and in cases where effects were found, they were the result of cost increases that were much larger than those that were estimated to result from the proposed regulation.

We recognize that shipping decisions are based on a variety of factors in addition to costs, including logistical considerations and access-to-markets. However, we also believe that cost considerations become more important when economic conditions deteriorate, and shipping margins become tighter. This may be particularly true for some of the Northern California ports, newly affected by this proposed regulation, that are closer to the port in Tacoma, Washington. For this reason, we believe it would make sense to revisit these potential cost impacts on California port competitiveness in light of the new economic realities.

68-7

## Conclusion

The COVID-19 virus has fundamentally altered the economic landscape. The Department of Finance May 2019 economic forecast and the EIA fuel price projections, and other inputs used by CARB to develop the benefits, costs, and economic impacts of the proposed regulation, are no longer credible. For these reasons, CARB’s existing SRIA would not accurately inform its Board and members of the public of the true economic impacts of the proposed regulation, and needs to be revised. It makes sense to delay action on the

proposed regulation at least until the economy emerges from the current crisis, and the post-COVID-19 outlook becomes clearer. At that point, CARB should re-estimate the proposal's impacts based on assumptions that more accurately reflect the economy in the post-COVID-19 world.

Please feel free to contact me if you have any questions about the information contained in this letter. I can be reached at (916) 761-2574.

Sincerely,

A handwritten signature in black ink that reads "Brad Williams". The signature is written in a cursive style with a long horizontal flourish at the end.

Brad Williams  
Chief Economist  
Capitol Matrix Consulting

Enclosure: Author Biography

## Author Biography

**Brad Williams** joined Capitol Matrix Consulting (CMC) in 2011 after serving in various positions in California state government for nearly 33 years. During the past nine years at CMC, Mr. Williams has been involved in hundreds of projects covering energy and regulatory policy, economic forecasting, economic impact analysis, and state and local government taxation and finance. During his prior three decades in state government, Mr. Williams served in key positions in the State Treasurer's office, Assembly Appropriation Committee and the Legislative Analyst's Office, where he was chief economist and Director of Budget Overview and Fiscal Forecasting. During his government career, Mr. Williams was regarded one of the state's top economic and fiscal experts, and he was recognized by the Wall Street Journal as the most accurate forecaster of the California economy in the 1990s.

**Subject:** PMSA Comments on the Supplemental 15-Day Notice for the At Berth Regulation and Related Environmental Assessment

PMSA appreciates the opportunity to comment on the proposed At Berth Regulation and Supplemental 15-Day Notice. The following comments are inclusive of the Supplemental 15-Day Notice as well as the Initial Statement of Reasons, Environmental Assessment, Standardized Regulatory Impact Analysis, and Supporting Regulatory documents.

PMSA is submitting extensive comments on behalf of its member companies which are providing critical and essential services in the midst of the global COVID-19 pandemic. However, we are concerned that this rulemaking process is proceeding during this crisis as our member companies are engaged in responding to this crisis by developing and *implementing* emergency procedures to address active coronavirus cases and prevent further infections, ensuring that their staff and communities are safe, and maintaining the supply chains that allow the U.S. and international response efforts to be executed and our communities to successfully shelter-in-place. As a result, meaningful public participation in this rulemaking is significantly impaired as the ability of the impacted and regulated industry to review, understand, and comment on proposed regulations is severely constrained at this time.

In a previous letter on March 20, 2020, industry stakeholders including PMSA reached out to the California Air Resources Board (CARB) and Cal/EPA outlining the impacts of the crisis on our industries and requesting consideration of a pause in this rulemaking during the crisis. No specific response to this letter was ever received. PMSA believes that the transformative effects of this crisis as laid out in this letter rise to the level of needing a pause and reassessment.

*Material and Significant Changes in Economic and Environmental Circumstances*

The scale of the current crisis is unprecedented. Every key economic assumption in the CARB estimate of the proposed regulation has been dramatically affected by COVID-19 and the ensuing shelter-in-place orders. IHS Markit economists over the course of one week in March lowered their projection for 2020 US real GDP growth from a decline of 1.7 percent to a decline of 5.4 percent.<sup>1</sup> The impact to the

---

<sup>1</sup> [https://www.joc.com/maritime-news/container-lines/container-industry-fallout-coronavirus-linger-2021\\_20200407.html](https://www.joc.com/maritime-news/container-lines/container-industry-fallout-coronavirus-linger-2021_20200407.html)

maritime industry is even larger. The World Trade Organization (WTO) has estimated that global trade could decline up to 32% this year.<sup>2</sup> Consequently, the analyses on which this rule is based are out of date and no longer valid.

*Previously Faulty Assumptions On Containership Growth Rates are Now Even More Facially Incorrect*

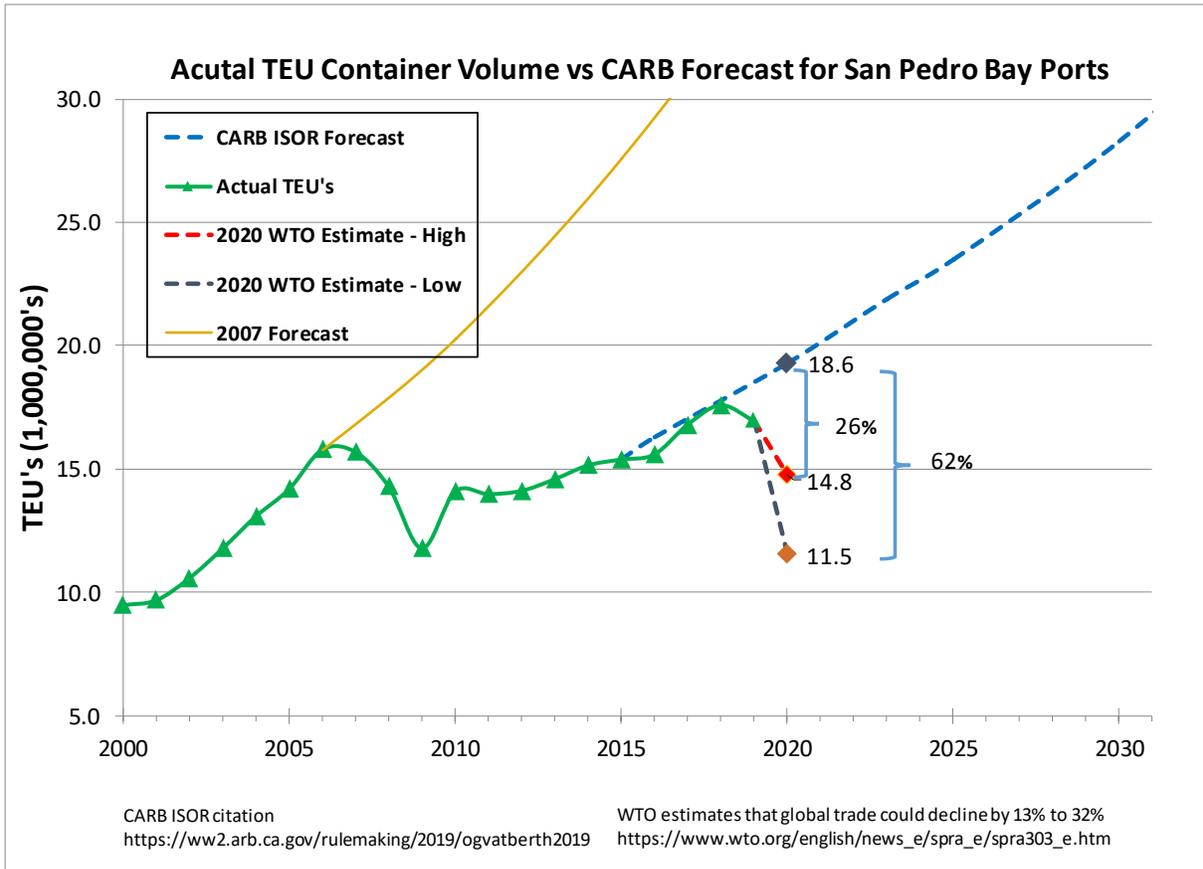

The underlying ISOR/SRIA analysis, upon which the 15-day Notice relies as well, is predicated on strong growth assumptions based on a number of forecasts. Prior to the current crisis, those forecasts were in doubt. For example, the analysis assumes that from 2016 (the inventory base year) through 2020, cargo at the ports of Long Beach and Los Angeles would grow 4.5% per year. Last year (before the current crisis), cargo throughput at the two ports declined 3.3%.

Since the crisis, the decline has accelerated, with year-over-year declines in January (-5.1%), February (-16.9%), and March (-19.7%). Before even considering the rest of the year, according to SeaIntelligence, 435 sailings have already been eliminated due to the COVID-19 crisis,<sup>3</sup> the current market upheaval means the emissions inventory contained in the ISOR, SRIA, and the 15-day Notice is wrong. That gap only grows if the rest of 2020 is forecast based on WTO projections, as shown in the figure below for the San Pedro Bay Ports:

---

<sup>2</sup> [https://www.wto.org/english/news\\_e/spra\\_e/spra303\\_e.htm](https://www.wto.org/english/news_e/spra_e/spra303_e.htm)

<sup>3</sup> <https://www.seatrade-maritime.com/containers/container-line-blank-sailings-increase-435>

By the end of this year, the baseline forecast used in the ISOR will overestimate cargo volumes by between 26% and 62%.

While everyone hopes that the economic and cargo disruptions posed by this unprecedented crisis are short-lived and temporal, there is no enunciated or clear justification for a theory that cargo volumes will quickly return to normal. To the contrary our experience and the historic precedent is that we are facing a long climb out. Prior to the Financial Crisis, the 2007 Forecast estimated that cargo volumes would grow to 65 million TEU by 2030. Following the decline from the last recession, cargo never recovered to their pre-recession levels of growth and it took a decade just to re-establish pre-recession volumes (see chart above).

Similarly, even if the pandemic itself is temporal as we all hope, the impact of the crisis is not likely to be short-lived. A new McKinsey study estimates that recovery in the USA could take until 2023.<sup>4</sup> With each year, the gap between the ISOR forecast and reality will grow larger, further distorting the analyses predicated on the forecast. Lloyd's List reported that in the view of BIMCO's chief shipping analyst, any recovery in container shipping will come from an extremely low base and that the global health crisis had "ruined every forecast and projection" for the sector. The report continued that "BIMCO expects no V-shaped recovery 'nor any other letter in that game', but a slow and gradual return to what will become a 'new normal'."<sup>5</sup>

Whatever the next decade holds for cargo growth, the only thing that is certain is that it is not represented by the strong growth forecast contained in the ISOR. The estimates of benefits, emissions estimates, costs, cost-effectiveness, and health impacts, which presume the rate of growth contained in the ISOR, are now no longer valid. Even if growth were to immediately resume at levels assumed in the ISOR, cargo volumes and resulting activity will be millions of containers off from the cargo volume estimate.

#### *Ro/Ros*

The crisis is also forecast to impact auto sales in this country and globally. Decreased auto sales will translate into reduced Ro/Ro activity. A forecast by Automotive from Ultima Media<sup>6</sup> indicates that it will take most of this decade for auto sales to return to their pre-crisis levels. The base case scenario has volumes declining from 2019 by 14%. In a worst-case scenario, volume declines would plunge 28% from 2019 levels.

**US Automotive Sales Volume Forecast Under 3 Scenarios 2017-2030 (units)**

Source: Automotive from Ultima Media

**US Automotive Sales Volume Drop Compared to BAU Under 3 Scenarios 2017-2030 (units)**

Source: Automotive from Ultima Media

As was the case for other vessel categories, the forecast upon which the Ro/Ro analysis was conducted is no longer valid. While the Automotive from Ultima Media forecast auto sales slightly growing by the end of the decade, the proposed rule is based on a growth rate that would see Ro/Ro activity 83.5% higher than 2016 levels in the ports Los Angeles and Long Beach by 2030 and 31.9% higher at the Port of Hueneme<sup>7</sup>. These numbers are not realistic or a reasonably foreseeable outcome of the current economic climate.

In order to be meaningful, accurate, and facilitate CARB's stated policy goals, the ISOR must be revised to take into account these effects and their material and significant impacts.

CARB is already well aware of the fact that the economics of the current pandemic are material to the State of California, and must act consistently with the state government's stated evaluation of our new economic reality. On April 10, the California Department of Finance (DOF) sent a budget letter to the Legislature alerting them to the dramatic impact that the COVID-19 pandemic is having on the California economy and state budget<sup>8</sup>. In the letter, DOF indicated that the effects of the downturn will be felt immediately, that the California unemployment rate could peak at a rate higher than the Great Recession of 2008, and that economic softness could persist into 2020-21 and additional years depending on the pace of recovery to local, state, and national economies. It referenced a multi-year recession alternative included in its January budget, and indicated that actual increases in unemployment would be much larger.

CARB also should maintain DOF consistency when addressing material and significant changes in its ISOR, SRIA, and 15-Day Notice by noting the California's Legislative Analyst's Office (LAO) description of the scope of the economic change that the State is witnessing and the wide-ranging variables and uncertainty associated with the rates, scope, and scale of a potential recovery.<sup>9</sup> In a document titled "Preliminary Assessment of the Economic Impact of COVID-19" released on April 16, 2020, the LAO declared that "Job Loss and Abrupt Halting of Economic Activity Make It Clear That We Have Entered a Recession". This assessment was initially confirmed with news reports of 1<sup>st</sup> Quarter GDP results<sup>10</sup>.

#### *Analyses Must Be Revised in Light of New Data*

CARB cannot proceed now without knowingly ignoring material and significant changes to the economic and environmental impact data upon which all of its rulemaking and CEQA clearance documents rely. Therefore, proceeding now, without revising its analyses in light of new data would be untenable. PMSA does not request that CARB cease work on amendments to the At Beth regulation, as some have unfortunately characterized these comments; to the contrary, we are asking that CARB program staff

work closely with stakeholders to ensure that rulemaking proceed properly. We recommend that the Board direct its staff to proceed in the following order: First, CARB should pause the rulemaking and begin working with the port authorities to develop new cargo volume and cruise visits projections that will serve as the basis for re-analysis of the proposed rule. Second, CARB should revise its assumptions based on the comments previously submitted by stakeholders that demonstrate costs have been underestimated and emission reductions and health benefits have been overestimated. Finally, CARB should re-evaluate baseline emissions, proposed emission reductions, health benefits, costs, and cost-effectiveness based on a revised forecast and assumptions.

69-1

*Previous Comments Unaddressed and Incorporates Previous Comments by Reference*

Independent of the material and significant crisis-related changes noted above, PMSA is concerned that our comments on the Initial Statement of Reasons (ISOR) were not addressed or considered in the 15-Day Notice. Extensive technical comments on cost, infrastructure, and feasibility were submitted with supporting information. PMSA incorporates by reference our comment letter, dated December 9, 2020, on the ISOR<sup>11</sup>. Accordingly, we request that CARB staff review and respond to all industry comments prior to Board consideration of the proposed regulation.

*At Berth Regulation Should Be Bifurcated*

The new proposed regulatory framework proposes a single structure for the regulation of disparate vessel types despite the persistence of the same disparities which existed at the time of the initial rulemaking.

Under the existing rule, container, cruise, and refrigerated vessels have been able to successfully comply through a fleet average approach that encourages long-term planning and incentivizes overcompliance in order to manage trade uncertainty. Carriers voluntarily over comply in order to preserve flexibility to accommodate trade surges, vessel redeployments, or unexpected equipment repair/maintenance. The proposed structure would eliminate any incentive to over comply and encourage carriers and terminals to exhaust available Vessel Incident Event (VIE)/Terminal Incent Event (TIE) allowances to reduce cost.

CARB should maintain a fleet average approach for the existing regulated fleet in order to ensure its continued success and consider the creation of a separate regulatory structure for any expansion fleets.

The preservation of the existing regulatory structure for currently regulated fleets and consideration of a new regulation for expansion to new fleets can be achieved in a manner which does not impact any projected emissions reductions. It is simply an acknowledgment of the original bifurcation by CARB of vessel fleets over a decade ago and the continued investments and emissions reductions progress made by the currently regulated fleets in expectation of the durability and continuation of the current regulatory program for the foreseeable future.

---

<sup>11</sup> <https://www.arb.ca.gov/lists/com-attach/61-ogvatberth2019-B2tQMwZkAAhSyM0d.pdf>

During the December 5<sup>th</sup> CARB hearing, Board members directed staff to investigate bifurcation of the proposed rule, recognizing the disparate nature of the fleets the proposed rule attempts to regulate. The 15-Day Notice does not provide that any such investigation occurred or discuss why CARB staff remains opposed to proceeding with amendments to the current regulation for currently regulated vessel fleets in order to achieve their rulemaking goals. Accordingly, PMSA again requests that the Proposed At Berth Control Measure be bifurcated, consistent with Board direction, into one set of amendments for the existing fleet regulations and another entirely new regulation which is exclusively applicable to expansion fleets.

*2021 Implementation Date is Infeasible and Accelerated Deadlines are Unachievable*

As was demonstrated in multiple comment letters, the original deadlines were unachievable. The rule demonstrated this absurdity by requiring facility plans to ensure compliance six months after compliance is required. The only engineering analysis in the record was submitted by the ports of Long Beach and Los Angeles that demonstrated, based on actual past experience, that more time was necessary to implement the proposed rule. No engineering analysis was conducted by CARB and no information has been made part of the record to support the accelerated deadlines proposed in the 15-Day Notice. The accelerated deadlines for tanker and Ro/Ro vessels cannot be achieved.

It is also unfair to the existing regulated fleets to provide essentially no transition period from the current regulatory structure into the new proposed regulatory structure. Given the COVID-19 timeline and impacts described above, along with delays to the adoption of the rule by CARB and OAL resulting from the crisis and additional time built into the rulemaking calendar, prior infeasibility concerns regarding the potential implementation date of 2021 are now even more acute.

*US EPA Waiver Requirements Also Render 2021 Implementation Impossible*

One of the primary reasons to amend the current rule (as opposed to creating an entirely new regulation in its stead) is to maintain the effectiveness of the existing regulation, which already has a waiver from the United States Environmental Protection Agency (USEPA) granted under §209(e)(2) of the Clean Air Act in 2011. CARB sought and was granted the waiver from USEPA as the existing At Berth regulations implement emissions standards applicable to the running of auxiliary engines while at berth in California's ports. (76 FR 77515) This waiver was granted after previous auxiliary engine emissions standards were determined to be unenforceable by ARB without the prior issuance of a US EPA §209(e)(2) waiver and after objection to the waiver by PMSA. See *Pacific Merchant Shipping Association v. Goldstene*, 517 F.3d 1108 (9th Cir., 2008).

Now that the industry has invested an estimated \$1.8 billion in the equipment and infrastructure necessary to make the current shore power regulation a workable framework for vessel and port operations in California, PMSA believes that the tremendous investment in the existing emissions reductions infrastructure on vessels, and on shore by ocean carriers, marine terminals, and ports under the existing waiver needs to be protected and preserved. The US EPA waiver process is one component of the Clean Air Act that ensures the preservation of the current and previously adopted regulatory

structure in a uniform manner nationwide, as an alternative emissions standard over and above or in addition to a US EPA standard, and that the adoption or change to any existing uniform rule is completed in the best interests of the currently regulated vessel fleets, CARB, and the entire United States.

Preservation of the current rule and existing waiver by continuing the existing regulation and bifurcation of the amendment process into currently regulated fleets and currently non-regulated fleets also maintains the clear and unambiguous legal status of the existing emissions standards under the current law, avoids any disputes over the authority of ARB to enforce emissions standards on vessels at berth upon the effective date for new amendments, and takes advantage of the existing waiver in order to foster continued national standardization of shore power rules for vessels which have already made a substantial investment in the retrofits necessary to comply.

By contrast, the proposed rulemaking abandons the current rule and the current waiver, and instead promulgates a new emissions standard for not just the newly proposed regulated vessel categories but also for existing regulated vessel categories, ports, and marine terminals.

Regulations for vessels at berth, including specifically any newly promulgated emissions standards, are legally unenforceable without the provision of a new waiver. Such a waiver request from CARB might not even be properly before the USEPA for consideration by January 1, 2021, and it is not reasonable to expect that one would be granted in that time period. PMSA views the elimination of the current rule and existing waiver as an unnecessary complication that should be studiously avoided. We would instead ask that ARB keep the current rule for the currently regulated fleets and make amendments to this existing rule which are either consistent with the existing waiver or which could be addressed with US EPA within the context of the existing waiver via future amendment.

If for no other reason than to maintain legal clarity and consistency within the At Berth program, CARB should take every step possible to ensure that the existing US EPA waiver remains in place and controls the lawful extent of CARB enforcement until a new waiver is granted.

*Proposed Changes Are Not Consistent with "15-Day Change" Requirements*

Accelerating deadlines in the rule by 33% for tankers and 25% for Ro/Ros with no evidence to support the feasibility of the proposal is not a reasonably foreseeable change to the proposed regulation. As a result, these changes are not appropriate for a "15-Day Change" notice. The changes substantially alter the impact and implementation of the proposed rule. CARB staff should recirculate the proposed changes as a "30-Day Change" notice.

The purpose of the "15-Day Change" notice is to provide flexibility for *de minimis* changes that do not require substantial new analysis. The proposed changes have required concurrent changes to every element of the analysis: costs, emissions inventory, and health benefits. Even worse, the impact of an

accelerated schedule on costs are not disclosed, eliminating the opportunity for stakeholders to provide comment on the change.

*De Facto Establishment of a New Ambient Air Quality Standard*

The 15-Day changes proposed for the At-Berth Regulation include an acceleration of health benefits to the public, which in turn purportedly justify increased costs. However, those health benefits are based, in part, on an “Incidences per Ton” analysis to determine reduced mortality and morbidity outcomes. This is the use of a new air quality standard and a deviation established State and National Ambient Air Quality Standards and/or reduction of risk from an identified Toxic Air Contaminant.

The use of standard metrics has long been established through public processes that set standards for ambient air quality standards or identifying the toxicity of specific contaminants. Through a public process, CARB must provide the scientific basis for public scrutiny that the agency will later rely upon to establish new rules that move the State toward achieving the air quality standards or reducing risk exposure.

The analyses contained in the ISOR and 15-Day changes has deviated from this long-standing approach. In addition to the traditional analysis of risk reduction, the document presents the morbidity and mortality benefits of the proposed regulation as a result of a reduction in particulate matter through the “Incidents per Ton” analyses. The analyses purport health benefits even in areas that are in attainment for the health-protective ambient PM standards. However, CARB has not established through any public process the basis of these analyses. There has been no public process to determine at what concentrations health impacts occur or if there is an appropriate standard, if any, that the State should be seeking to achieve.

The analyses imply that there is no ambient concentration of particulate matter that does not result in health impacts. In essence, the Health Analyses is establishing a new *de facto* ambient particulate matter standard of zero parts per billion. By contrast, ambient air quality standards, identification of toxic air contaminants, and even the framework of health risk analyses have been subject to extensive public review.

The use of a new standard that has not been subject to a public review process is fundamentally an underground regulation. CARB is able to provide justification for new regulations without subjecting the *de facto* standard implied by the analyses to its own broad public review. CARB should immediately remove the “Incidents per Ton” as a basis for the proposed rule. The approach itself has not gone through its own extensive public review; it should not be relied upon as justification for the draft regulatory concept.

*CAECS Responsibilities*

PMSA appreciates the changes that make clearer the responsibilities of CARB approved emission control strategies (CAECS) operators. However, the revisions do not go far enough in laying out clear lines of

responsibility. For instance, Table 6 still identifies Terminal and Vessel as potentially responsible for CAECS failure, in addition to the CAECS operator. Only the CAECS operator should be responsible for failure of a CAECS system. In addition, Section 93130.15 makes clear that CAECS are eligible for use of the Remediation Fund, but Section 93130.12 only requires a CAECS operator to remediate excess emissions if excess emissions occur beyond three days. Under the proposed language, it is unclear which party is responsible for the first three days of excess emissions or if emissions must be remediated for connection delays. This ambiguity must be corrected to make clear that the CAECS operator is responsible for all excess emissions from performance in terms of arrival, connection, and departure and performance in terms of emissions control.

*Liquid Bulk Vessels Must Be Regulated Equitably and Consistently Across Proposed Rules*

CARB is attempting to promulgate multiple rules impacting vessel operations simultaneously, but the proposed rules are internally inconsistent. With respect to the proposed regulatory framework for the proposed At Berth Regulation and the proposed Harbor Craft Regulation, the results of these two rules will bifurcate vessels serving the same trades resulting in inequitable and inconsistent regulation. Both traditional liquid bulk vessels and articulated tug barges (ATBs), which are ocean-going tanker vessels, are proposed to be regulated substantially differently. Both vessel types move liquid bulk cargoes, ply interstate and international trade lanes, and operate substantially outside California waters. Both vessels should be treated similarly under an air quality regulatory framework. In fact, ATBs meet the CARB definition of an ocean-going vessel and should be regulated as such. Nonetheless, CARB has proposed to treat the vessel categories differently and without providing evidence why ATBs should be regulated differently. CARB should revise the proposal and not arbitrarily exclude ATBs under the definition of ocean-going vessels.

*Increased Costs of Proposed 15-Day Changes Not Disclosed, Detailed, or Analyzed*

The 15-Day Changes propose accelerating the schedules of compliance for vessels which increases costs in multiple ways. However, the “15-Day Change” notice provides no detail on how costs are increased. There is only a vague statement that total program costs have increased by \$210 million. It attributes increased costs to the accelerated schedule and to the inclusion of the Innovative Concept section but does not identify what those costs are or how they arise. The nature and mix of costs are important to understanding the economic impact. As the Department of Finance (DOF) pointed out in its comment on the Standardized Regulatory Impact Assessment (SRIA):

“the SRIA must include non-annualized capital costs. Capital costs are almost half of the direct costs of the package. However, because new facilities are required for compliance, these capital costs may not be spread evenly across the effective period of the regulation as ARB assumes, but will depend on the ability of parties to finance up-front costs. The SRIA should disclose the cost of capital construction to the year the money will actually be spent, as well as the assumed amortization.”

The proposed acceleration of the deadline compounds the issue that DOF identified. Without detailed information on the increased costs, it is impossible to assess and provide impacts for those increased costs.

#### Remediation Fund

The language restricting the use of Remediation Funds in Section 93130.16 is so broad as to potentially bar any conceivable project and must be revised. The restriction on projects identified in AB 617 Community Emission Reduction Programs (CERP) is inappropriate on two counts. CERPs are not enforceable and there is no guarantee that projects identified in CERPs will be initiated. As a result, CERPs actually outline projects that should be prioritized for funding from sources such as the At Berth Remediation Fund. In addition, CERPs represent communities that the State has identified for new investment. The proposed language would functionally cut off identified communities from a funding source.

The prohibitive language is also too broad on legal requirements and Memoranda for Understanding (MOUs). All projects that can possibly be envisioned for use under the Remediation Fund will be subject to some legal agreement on implementation. Agencies establish MOUs specifically to identify potential emission reduction opportunities and facilitate access to various funding mechanisms. Mitigation measures are often subject to constraints on available funding. All agreements and MOUs are contracts that result in enforceable legal requirements. Without these tools, the projects that CARB envisions cannot be completed.

PMSA proposes that the Remediation Fund have the same limitation that CARB always uses for incentive programs that the projects result in emission reductions that are real, quantifiable, verifiable, enforceable, and surplus. Each of these elements have a long history in delivering emission reductions to local communities. The addition of other language only serves to obscure what projects could be eligible and would likely result in counter-productive restrictions on the use of funds in port communities.

#### Innovative Concepts

Another major proposed change would allow the use of certain “Innovative Concepts” (IC) to meet compliance obligations. CARB staff present the “Innovative Concepts” provisions as an alternative compliance pathway, but as currently written the proposal would fail to serve that purpose. A number of changes are necessary in order for the IC section to be workable.

- A fleet averaging concept should be a defined path within the IC section. Fleet averaging, as a program whose parameters are known, should not be subject to unnecessary restrictions for new concepts. Given the known success of fleet averaging to reduce emissions, it is not necessary to create uncertainty by having a three-year term with extension subject to uncertain approval.

- There should not be a set term for IC plans. As written, the IC section requires regulated parties to repeatedly apply for and receive CARB approval to use an “Innovative Concept” for limited three-year terms. Different concepts may require different terms in order to recoup any necessary investment. A one-size-fits-all approach is unwarranted and unnecessary. The term for any IC can be determined individually.
- While ICs must be “surplus” at the time of creation, CARB could revoke or decline to renew approval if the emission reduction became subject to regulation at a future date or by any CARB-approved AB 617 Community Emission Reduction Plan. The IC section should be modified to allow IC reductions without this limitation.
- Limiting the location of IC emissions reductions only to “adjacent” communities and distances no greater than 3 nautical miles may have unintended consequences. Neither “adjacent” nor “community” are defined in the Proposed Regulation, so it is unclear how close an area would need to be in order to be deemed “adjacent,” and where the boundaries of that area would end. The IC section should be modified to encourage any project (adjacent or not) that would benefit the port and terminal communities.
- The IC section sets a deadline for submitting a proposal. This implies that ICs will not be considered after 2021. We do not believe it was the intention of staff to limit development of IC to the first six to twelve months of the proposed rule’s implementation. The deadline should be removed and replaced with a process for IC plan review at any date such plans are submitted in the future.
- The prohibition on public funding for ICs is too broad. Funding may come from different sources, including federal, other states, or other nations. In addition, such a prohibition would exclude demonstration projects. Fleets that are likely to engage in ICs, including fleet averaging, are also likely to participate in demonstration projects sought by CARB or other air quality agencies. Being innovative should not prohibit technology advancement.
- The requirement that “if no environmental review is determined to be required by a local lead agency, the applicant must submit documentation from the local lead agency explaining environmental review is not required” does not make sense in the context of the California Environmental Quality Act (CEQA). It is not normal for an agency to affirmatively state it is not taking action under CEQA; it simply does not act. The environmental review provision should be limited to the review of CARB’s action, if any. If CARB determines environmental review is necessary, it must conduct that review unless another lead agency is identified. CEQA already contains provisions for addressing conflicts between multiple lead agencies. If CARB determines that its action does not require environmental review, it is not necessary to determine if other lead agencies may exist.

- Revocation of an IC plan provides for a 30-day notice. This is likely to be inadequate for an ocean carrier to transition to original provisions of the rule. The risk of a 30-day transition at the uncertain end of a three-year program is enough to prevent an ocean carrier opting to implement an IC. The IC section should include a nine-month transition period upon revocation of an IC plan.
- For the reasons described above regarding the Remediation Fund, PMSA proposes that ICs have the same limitation that CARB always uses for determining whether a proposed project results in “real” emission reductions. Any proposed IC should result in emission reductions that are real, quantifiable, verifiable, enforceable, and surplus. Each of these elements have a long history in delivering emission reductions to local communities. The addition of other language only serves to obscure what projects could be eligible.

#### LCFS Considerations

The economic analysis presented by CARB shows Low Carbon Fuel Standard (LCFS) credit-derived revenue offsetting electricity, labor, and infrastructure costs without restriction. At the time of this letter, CARB LCFS staff is still preparing guidance on the “Use of Proceeds” under the LCFS regulation. As a result, it has not been clear what costs are eligible for offsets on the LCFS “Use of Proceeds” requirements. Please confirm that shore power-related electricity, labor, and infrastructure costs are eligible offsets for shore power-generated LCFS credit revenue.

#### Summary of Proposed 15-Day Changes and Impacts on Costs Inconsistent with Proposed Regulation

The summary of the impacts on costs states that emission reductions can be achieved for \$30,000 per weighted ton and the cost analysis for the proposed regulation has been updated to reflect that cost assumption based on information from PMSA and WSPA. The referenced PMSA email concerned the appropriate value of the remediation fund, since the purpose of the remediation fund is to replace unmitigated auxiliary engine emissions. If CARB staff believes that number accurately reflects the costs to offset uncontrolled emissions, the hourly remediation fund rate should be adjusted to reflect that. If CARB does not believe that the \$30,000 per weighted ton estimates of cost reflect the cost of replacement emission reductions, then the cost estimate prepared by CARB should reflect the higher value used to establish the remediation fund rate. CARB should not select higher and lower costs in order to achieve a preferred outcome depending on each situation.

#### Fundamental Problems with Emissions Inventory Unresolved

Even before addressing the changes brought about by the COVID-19 crisis, the emissions inventory has not addressed known problems as described in previous industry stakeholder comment letters. The inventory overestimates growth, resulting in a significant overestimation of the proposed rule’s emissions benefit. The inventory does not consider the emission reductions associated with Proposition 1B funding, requiring emission reductions of 90% under the existing rule – 10% more than the proposed

rule. This results in the inappropriate attribution of emission reductions from existing requirements to the proposed rule. The emissions inventory also inappropriately caps emission reductions under the existing rule at 80%. Every vessel with a call greater than 15 hours will result in emission reductions greater than 80%. In San Pedro Bay, where calls greater than 100 hours are typical, emission reductions can exceed 97%. Yet, no reason is given in the emissions inventory for capping emission reductions. The inventory must be updated to reflect these issues.

CARB inventory staff have acknowledged these issues in a variety of phone calls and emails with stakeholders and have indicated that these issues will be resolved sometime this summer. That delay does a disservice to both the public and decisionmakers in understanding the benefits of the proposed rule changes.

Additional CEQA/EA Considerations

In addition to the previous issues described in this letter that require additional evaluation under the California Environmental Quality Act (CEQA), the changes to the proposed regulation will result in the need for revised environmental assessments. Among the proposed changes, the lead time for tankers will be reduced by 33% and for Ro/Ros by 25%. These changes represent significant new information and a substantial change to the project description that triggers the recirculation of the environmental assessment under CEQA. In addition, by accelerating the deadlines, more infrastructure work will be required over a shorter period of time. A foreseeable consequence is that overlapping construction will lead to higher peak emissions. The California Environmental Quality Act (CEQA) requires that these changes be evaluated.

69-3

The COVID-19 crisis and its impact on future cargo volumes, emissions, and benefits of the proposed regulation also represents significant new information requiring review, analysis, and recirculation of the environmental assessment. As described earlier, forecasts used in the analysis of the proposed regulation may overestimate activity by 62% by the end of this year alone! The environmental assessment must be revised to reflect this new reality.

Timed Connection Requirement

CARB staff has revised the one-hour limit on the connect and disconnect times for shore power to a two-hour connect time limit and one-hour disconnect time limit. While it is appreciated that the infeasibility of the one-hour requirement was acknowledged, a two-hour requirement is still arbitrary and capricious and not based on any evidence that it is safe or feasible. As we have said in previous letters, the existing rule permits multiple connection strategies, some of which will require more than one hour. More importantly, the shore power connection process requires individual people to manhandle heavy, high-voltage equipment and energize that equipment – sometimes in adverse weather conditions. Under no circumstances should that work be performed under a stopwatch. The two-hour requirement would likely be ineffective because any exceedance of the one-hour requirement would likely result in a safety exemption being sought, as having labor move faster handling high voltage equipment would be fundamentally unsafe.

69-4

CARB staff has still provided no basis on which it can be assumed that connection times can be consistently and safely accelerated. In fact, no data is available from CARB justifying the previous one-hour connection window or the new two-hour connection window under the original ISOR or in the 15-Day Change Notice.

#### Opacity Requirement

The proposed rule establishes an opacity limit for vessels at anchorage. Such a requirement conflicts with established International Maritime Organization (IMO) and USEPA emissions standards for vessels. USEPA rules preempt state and local emissions standards for oceangoing vessels. While not quantified as a typical numerical standard but a limit based on Ringelmann values, an opacity limit is clearly an engine emissions standard for an operating vessel – even if that operation is at anchorage. Such standards should be promulgated for new engines and done so through existing IMO/USEPA framework. Accordingly, CARB should eliminate the proposed emissions standard from the regulation. Moreover, the novel treatment of vessels At Anchorage should be removed from the regulation for vessels At Berth as they present fundamentally different topics of regulation, on fundamentally different subjects of regulation, and often impact completely separate and different off-road engines. The inclusion of an entirely new class of potential engines, fuel, and emissions standards in this rulemaking is unsupported by significant data in the ISOR, SRIA, or 15-Day Change Notice, and is also subject to the granting of a waiver by USEPA separate and independent of the existing waiver approved for the current regulation.

#### Commissioning

In discussions with CARB staff, PMSA understands that the proposed requirement that “[t]he port or terminal operator is responsible for commissioning vessels equipped with compatible shore power that is installed on the side of the vessel facing the wharf when berthed” means that upon the commissioning visit of a vessel to a terminal, the terminal can indicate whether their terminal will commission the vessel starboard side to or port side to, consistent with the design and operation of the terminal. PMSA believes that ports and terminal operators are responsible for commissioning vessels without the need for the enunciation of such responsibility in regulation as issues of berthing should be privately agreed to between the terminal operator and ocean carrier and not be prescriptively enforced through regulatory mechanism. PMSA recommends that CARB strike all prescriptive language on berthing orientation and allow terminal operators and ocean carriers to actively manage these issues privately amongst the two parties for peak efficiency.

#### Reporting for Bulk Vessels Should Be Eliminated

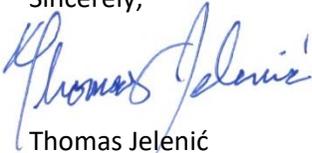

The reporting requirements for general cargo and bulk vessels add a real, quantifiable burden to bulk and general cargo vessel operators, but do not advance any emissions reduction program in California. The State should not impose costly reporting requirements for the sole sake of collecting more information, particularly when there is no planned use for that data. If CARB identifies a future need for such data, it is readily available through alternative sources such as marine exchanges or port authorities. There are even existing regulatory tools in place like the OGV fuel rule that CARB can use to

obtain vessel information and ensure significant emission reductions. There is no reasonable basis to place a permanent, costly reporting burden for no measurable or identified benefit.

We appreciate the opportunity to provide these comments on the 15-Day Change Notice and to incorporate all prior correspondence on the proposed regulation documents, including under CEQA, by reference. PMSA respectfully requests that CARB staff directly address all original and supplemental technical issues, including those which address the underlying economic and emissions inventory analyses and how those analyses have materially and significantly changed since their publication, prior to calendaring this proposed rulemaking before the CARB Boardmembers so the public and the Boardmembers can consider the actual facts, impacts, and considerations which exist with respect to the adoption of the substantive amendment of the existing At Berth Regulations.

69-5

Sincerely,

Thomas Jelenić

Re: Marathon Petroleum Corporation's comments on the California Air Resources Board proposed Control Measure For Ocean Going Vessels at Berth regulation.

Dear Chairwoman Nichols and Honorable Board Members.

Marathon Petroleum Corporation (MPC) appreciates this opportunity to provide comments on the proposed Control Measure For Ocean Going Vessels at Berth regulation, the "At-Berth regulation". MPC is a refiner, logistics provider and marketer of petroleum products in California. MPC through subsidiaries, owns and operates two refineries located in Northern and Southern California. Each refinery relies on Ocean Going Vessels (OGV's) every day to make deliveries to its terminals so its refineries can turn crude oil into products that residents and visitors to the state rely on every day to make their lives better. We are a member of the Western States Petroleum Association (WSPA), and we support and incorporate by reference the comments submitted to the Board by WSPA for the 15-day draft.

MPC takes pride in the safety of its operations and strives to enhance the lives of its employees and the communities where we operate. It is because of our marine operations expertise, that we have been very engaged in this rulemaking including hosting multiple tours of our operations to CARB management, staff and Board Members. MPC believes it is well positioned to contribute to the At-Berth rulemaking dialogue and appreciate CARB's willingness to consider our input on a few key items and final recommendations.

The At-Berth regulation is intended to reduce emissions from a single component of arguably the most complex logistics system in the world, on some of the largest machines in the world. Establishing a state regulation by which an OGV must reduce emissions at berth in a safe and cost effective manner is extremely challenging due to lack of feasible or proven technology for our industry application. Unfortunately, this proposed regulation does not consider these technology challenges and the time it takes to prove feasibility on a large scale.

These challenges have been compounded by the accelerated compliance deadlines which are not supported in the 15-day package.

- **MPC is concerned the accelerated regulatory expectation is placing added safety risk to its operations.** If a terminal were to choose a land-based capture system as its compliance method of choice with these changes it will now have two less years to ensure the machinery will function safely. This is a significant loss of time given the equipment has never been demonstrated on a tanker boiler or its potential hazards studied industry-wide.
- **MPC has long held the opinion compliance with this rule would require on the order of ten plus years given the infrastructure requirements and unique environments our terminals exist in.** CARB does not substantiate how a tanker vessel or terminal operator would require two less years to construct and install projects to control emissions. Stakeholders engaged in this rulemaking process over the last few years have seen three major revisions to compliance dates with little to no changes to available technologies to achieve the reductions. The 15 day changes to the compliance dates for the POLB/POLA and at all other terminals, is lacking any analysis for justification.
- **Assumptions used to determine cost impacts due to the accelerated compliance deadlines in the 15-day package are not available.** CARB indicates the changes will increase compliance costs from the initial \$2.2 billion to \$2.4 billion, a change of about 10 percent. But CARB fails to illustrate how this 10 percent cost increase is proportional to a 33 percent decrease in time to comply for the POLB and 25 percent decrease for all other terminals.
- **Accelerated compliance dates in the 15-day package to potentially require use of the remediation fund on an extended basis.** The remediation fund compliance option is intended to be used in limited circumstances. However, the accelerated compliance dates could cause operators to resort to having to use the option for a longer period of time. The terminal plan will provide a list of known constraints to CARB including those out of an operators control, such as permitting, availability of necessary equipment or labor to meet the compliance deadlines. MPC recommends that the regulation not require an operator to utilize the remediation fund compliance option if the operator is acting in good faith, investing in a CAECS or Innovative Concept, in accordance with an approved plan.

72-1

Lastly, as proposed, this regulation illustrates the barriers to cost effective emission reduction solution from OGV's. CARB's 2020 SRIA for this rulemaking determined the cost effectiveness for this regulation to be \$83,159 per weighted ton of emissions. In comparison, referencing California's 2016 State Implementation Plan (Benefits p3, and Table 5) a cost effectiveness value of \$12,000 per weighted ton of emissions results. The difference in cost effectiveness is driven by the scope of infrastructure projects at the terminals to support the identified technologies. MPC asks CARB to continue focusing on more cost effective emission reduction opportunities within the state, this will allow for emission reduction technologies associated with OGV's to mature.

For all these reasons MPC recommends CARB take the following steps:

- 1) Provide more time for regulated parties to comply. Given MPC's prior guidance any project to install equipment identified in the proposed regulation as a CARB Approved Emission Control Strategy (CAECS) would require ten plus years, pending the outcome of a feasibility study, more likely compliance dates for the POLB/POLA would be 2031 and all other terminals 2036.
- 2) Take advantage of the additional rulemaking time provided by Governor Newsome's Executive Order N-40-20, extending APA deadlines by 60 days to re-engage with stakeholders to address residual concerns.

MPC appreciates this opportunity to submit comments on the At-Berth regulations 15-day proposed amendments. Please contact me at 916.462.5063 with any questions.

Sincerely,

**Re: Second 15-Day Changes to the Control Measure for Ocean-Going Vessels At Berth ("At-Berth Rule")**

California Air Resources Board:

On behalf of Crowley Maritime Corporation (Crowley), we thank you for the opportunity to comment on the second 15-day changes to the At-Berth Rule proposed by California Air Resources Board ("CARB"). As the largest operator of tankers and ATBs in the United States, Crowley, whose tankers and ATBs operate regularly in California ports, is directly affected by the proposed regulation.

ATBs carry 15% of the clean petroleum products annually transported to and from California, and are a significant part of the ocean-going vessel traffic calling at California ports today. Crowley's ATBs of more than 120,000 bbl. capacity are the functional equivalent of ocean-going tankers and they should not be excluded from the At-Berth Rule.

Crowley fully supports the environmental goal of the At-Berth Rule to reduce emissions from ocean-going vessels docked at California ports. The current measure, which amends and supersedes the existing 2007 At-Berth regulation, offers CARB the opportunity to extend the At-Berth Rule to all categories of ocean-going vessels calling at California ports, including ATBs. Therefore, Crowley has, since the spring of 2019, consistently demanded that ATBs be included in the At-Berth Rule in order to achieve the maximum benefit of localized harmful emissions reductions, particularly for at-risk California communities.

By the second 15-day changes, CARB has focused on the operations of certain categories of vessels affected by the At-Berth Rule and proposed changes designed to achieve improved emissions reductions to benefit Californians living in the vicinity of its ports. The second 15-day changes thus provided CARB with the ideal opportunity to further strengthen the At-Berth Rule by the inclusion of ATBs. To date, CARB has failed to take this opportunity, and should do so now.

The second 15-day changes amend the definitions provision of the control measure, section 93130.2(b). These changes highlight the inconsistency of the definition used for ATBs and CARB's rationale for the ATB exclusion.

In the second 15-day changes, CARB amends the definition of ATB, subsection (b)(7), which now reads as follows:

“Articulated tug barge” means a tanker barge [sic] that is mechanically linked with a paired tug that functions as one vessel. For the purposes of this Control Measure, articulated tug barges are not considered ocean-going vessels<sup>1</sup>.

This definition makes clear that CARB defines an ATB as a tank vessel that functions as one vessel. This is correct: An ATB is an innovative, highly efficient, and flexible form of modern tank vessel. An ATB carries cargo in a tank barge with a double hull configuration, equipped with sumped cargo tanks, remote radar gauging, two ballast pumps, a dual-mode inert gas vapor collection system and other systems, and is propelled and maneuvered by a high-horsepower tug that is physically a part of the whole vessel, positioned in a notch in the stern of the barge, and attached by rigid, articulating pins. ATBs function as a single unit in a system that allows for improved maneuverability and sea-keeping. By definition, an articulated tug barge is an ocean-going vessel that functions “as one vessel.”

This definition is belied by CARB's stated rationale for excluding ATBs from the At-Berth Rule. In the Initial Statement of Reasons (“ISR”), CARB states as its sole reason offered for excluding ATBs from the At-Berth Rule is the following:

“When an articulated tug barge is fully connected, it may meet the definition of an ocean-going vessel, as defined in this chapter (Section 93130.2(b)). However, despite being defined as a subcategory of tankers, articulated tug barges are considered a barge and a tug separately.” [ISR, p. IV-6.]

---

<sup>1</sup> Under subsection (b)(82), the term “vessel” is used interchangeably with the term “ocean-going vessel.” The ATB definition in subsection (b)(7) is therefore internally inconsistent.

This statement of a purported rationale for the ATB exclusion is unsupported by reference to any industry studies, analyses or definitions, particularly as to under what circumstances, and by whom, an ATB in operation could be “considered” to be “a barge and a tug separately”. CARB offers no insight as to the source of its stated rationale, which is not borne out by Crowley’s experience of its ATB operations. During operations in California waters, an ATB of over 120,000 bbl. capacity is the functional equivalent of an ocean-going tanker. Based on their California operations, Crowley’s ATBs cannot be “considered a barge and a tug separately”.

When the rationale given in the Initial Statement of Reasons is compared to the definitions section in the second 15-day changes, the reason for the ATB exclusion is shown to be circular and entirely arbitrary. Where a barge and tug are separated, they do not and cannot function “as one vessel”. According to the regulations, as confirmed by the second 15-day changes, an “articulated tug barge”, *by definition*, functions as one vessel, not as “barge and tug separately”. A separated barge and tug therefore do not, and cannot, meet the regulatory definition, in section 93130.2(b)(7), of “articulated tug barge”.

In excluding ATBs from the At-Berth Rule, CARB failed to consider all relevant industry and environmental factors, and so it did not demonstrate any a rational connection between those factors, the choice made, and the purposes of the enabling statute. Under the circumstances, the only conclusion that can be drawn is that the continuing exclusion of ATBs from the definition of “ocean-going vessels” in the At-Berth Rule, as set forth in section 93130.2(b)(50) of the second 15-day changes, is that CARB refuses to reconsider an arbitrary and capricious decision it made at the outset of this regulatory process. CARB should now reverse this ATB exclusion before the final rule is submitted.

1-1

A Crowley ATB of at least 120,000 bbl. capacity should be regulated like any other ocean-going tank vessel. Crowley submits that, by including ATBs from the At-Berth Rule, CARB will not only improve air quality for at-risk communities in the vicinity of California’s ports, but it will also strengthen the At-Berth Rule by making it internally consistent and removing the arbitrary and capricious exclusion of a significant portion of ocean-going vessels calling in California.

CARB’s consideration of the second 15-changes affords an opportunity for CARB to delete the ATB exclusion in section 93130.2(b)(50). This exclusion that does not further the purpose of the At-Berth Rule to reduce emissions from ocean-going vessels docked at California ports and is operationally and practically unjustifiable.

Yours respectfully,

Re: Second 15-Day Changes on the Proposed Control Measure for Ocean-Going Vessels At Berth

Dear Honorable Board Members:

Thank you for the opportunity to comment on the Second 15-Day Changes for the Proposed Control Measure for Ocean-Going Vessels At Berth. South Coast AQMD staff appreciates the efforts by CARB staff in making subsequent modifications to the originally proposed regulation through two 15-day changes to address comments from all stakeholders.

As stated in our letter dated November 26, 2019, NO<sub>x</sub> emissions in our Basin need to be reduced by 45% and 55% beyond all existing regulations by 2023 and 2031, respectively, to meet the upcoming deadlines for attaining federal ozone standards. Ocean-going vessels (OGVs), combined with harbor craft, will represent the single largest source of NO<sub>x</sub> emissions in the Basin by 2023. Therefore, it is absolutely essential to maximize both short-term and long-term reductions in the proposed regulation to help achieve our attainment goals.

We support the adoption of the proposed At-Berth regulation with the Second 15-Day Changes and offer the following recommendations for your consideration:

### Compliance Date Changes

Under the latest changes, CARB staff proposes to delay the compliance start date for container ships, reefers and cruise ships by two years from 2021 to 2023 and allow these vessels to remain under the existing At-Berth Regulation without any additional controls beyond 2020. Although we recognize the potential economic impact on the maritime industry due to the coronavirus pandemic, we are concerned with the negative impact of this proposed change on NOx and diesel particulate matter (DPM) emissions. Based on data provided in the second 15-day document, the proposed delay in the compliance date would result in increased NOx emissions at berth by 0.74 ton per day (tpd) in 2021 and 0.79 tpd in 2022 (and 0.01 tpd of DPM in 2021 and 2022) in our Basin compared to the initially-proposed regulation in December 2019. Given the significant contribution of emissions from these vessels, uncertainties regarding potential impact of the pandemic on marine industry, and the need to achieve early reductions for our local port communities and the regional air quality, we believe the proposed two-year delay is too long. Instead, South Coast AQMD staff recommends a maximum one-year delay to provide a reasonable level of relief to the marine industry which will start the compliance date for container ships, reefers and cruise ships on January 1, 2022.

2-1

For RoRo vessels, South Coast AQMD staff supports the proposed change to return the compliance start date to 2025 as originally proposed. Staff also supports accelerating the compliance start dates for tankers by two years from 2027 to 2025 for tanker vessels visiting the Ports of Los Angeles and Long Beach and from 2029 to 2027 for tanker vessels visiting other ports (first 15-day changes).

### Innovative Concept

South Coast AQMD staff supports the innovative concept provision proposed in the first 15-day changes which provides options for the regulated entities to achieve equivalent emissions reductions through implementation of alternative control strategies in the port communities. The Second 15-Day Changes proposes to extend the compliance period for approved innovative concepts from three years to up to five years. South Coast AQMD staff is agreeable to this proposed extension as long as the benefits of the approved alternative control strategies are monitored, evaluated and quantified based on credible and transparent methodologies to ensure that the emissions reductions achieved are real, surplus, quantifiable and enforceable.

The proposed regulation is a significant rulemaking for the South Coast Air Basin. South Coast AQMD staff strongly supports the adoption of the Proposed At Berth Regulation as achieving emissions reductions from OGVs will be essential in meeting the ozone attainment deadlines in our Basin as well as providing considerable public health benefits in the port communities. We are also fully committed to continue to work collaboratively with CARB staff in the development and implementation of innovative programs to reduce emissions from OGVs and other sources.

Sincerely,

A handwritten signature in black ink, appearing to read "Wayne Natri", with a stylized flourish at the end.

**Subject: Maersk Comments on the Second Public Availability of Modified Text and Availability of Additional Documents and Information for the Proposed Control Measure for Ocean-Going Vessels At Berth, Board item ogvatberth2019**

Dear Board Chair Nichols and Mr. Corey,

Thank you for this opportunity to comment on the Second Public Availability of Modified Text and Availability of Additional Documents and Information for the Proposed Control Measure for Ocean-Going Vessels At Berth, Board item ogvatberth2019. We have provided five sets of written comments in 2019 - 2020 (March 8, March 26, June 10, December 6 and April 29th), as well as less formal communications including analyses of arrival time feasibilities. We also provided input and analyses to PMSA and the World Shipping Council to incorporate in their consolidated industry comments.

Maersk is an integrated international container logistics company, operating about 750 container vessels globally as well as marine terminals, warehouses and other essential supply chain functions. Each year 45 to 60 of our vessels make over 500 calls in California ports. Typically, each of these international vessels spends less than 5% of its operable lifetime in the waters of any one state or country. Network changes and vessel redeployments are an essential part of supply chain operations.

Maersk has long been an environmental leader in shipping. Since 2008 we have reduced our fuel consumed and related emissions by 43% on a per container per kilometer basis. We have committed to a 60% reduction and to launch a first carbon-neutral vessel by 2030 on our way to zero carbon emissions shipping by 2050. In the past Maersk voluntarily used dramatically cleaner fuels in California ports, and supported establishing both the California fuel rule and the North American Emissions Control Area. We are committed to going beyond compliance to

achieve environmental excellence and hope these comments will be taken in the constructive spirit with which they are offered.

We appreciate that some of our previous comments were considered and adopted and look forward to CARB's full response to comments. The comments in this letter will focus on the changes made in the Second 15-day package.

1. The notice and proposed regulatory language modifying the implementation, transition and reporting timelines are clear and well-written, and the use of strikeout formats to designate the changes was very helpful.
2. We greatly appreciate the 2-year continuation of the existing regulation and date adjustments to address the timeline inconsistencies identified the proposed rule, move past the worst of the COVID-19 disruptions, and conduct a thorough interim review. During this time the performance of the currently regulated fleets can be determined under the final requirements of the existing rule and related provisions such as Proposition 1B, which were implemented as of 1/1/2020.
3. **Plans and infrastructure timing:** The revised timeline is not fully aligned with public works project timing in the ports. For example, terminal and port plans are due December 2021, with CARB approval lasting up to 90 days. We question whether the required infrastructure improvements can then be funded, permitted and in place to support the 1/1/2023 implementation of the new rules for the currently regulated fleets. This is particularly troubling due to the lack of viable alternative CAECS in most California ports.

4-1

Recommendations:

- Include a provision to allocate additional VIEs or TIEs in locations where the necessary infrastructure improvements cannot be achieved in the allotted time.
- Consider allowing unlimited use of the remediation fund or other alternatives to achieve timely reductions and enable compliance in the gap between the vessel compliance dates and completion of needed infrastructure projects.
- Consider allowing use of the remediation fund in situations where no alternatives CAECS are feasible.
- During the 2 years before implementation of the new rule clarify the application and compliance options for lay-by berths and repair berths, where usage and access are by definition variable. Data on these facilities is limited, so the interim review should be used to determine any practicality issues and if needed, adjust the low activity terminals provisions.

4. **Interim review:** As directed by the Board on June 25<sup>th</sup>, the Interim review scheduled December 2021 should now cover the full shore power program. We look forward to working with CARB Staff during this period.

The interim review should address issues regarding rule implementation raised by stakeholders over the next two years. As work on implementation continues, it will be critical to resolve issues, including the sufficiency of TIEs/VIEs, incorporation of fleet averaging under Innovative Concepts or CARB Approved Emission Control Systems (CAECS), sufficient compliance pathways for non-frequent fliers, and other issues identified in this letter. This period should also enable updating of the emissions inventory projections.

5. **Innovative Concepts:** The Innovative Concepts (IC) section of the proposed regulation remains extremely complex. Changes should be considered to make the concept more viable as a long-term compliance option.

- a. We support the increase of the term from three to five years. This change will be helpful in encouraging investments. However the window of opportunity for proposals remains overly short, with plans due no later than 12/2021. This greatly limits the usefulness of this concept. CARB should consider ways to encourage innovation in emissions reductions by lengthening the opportunity to propose additional ICs after 2021.
- b. Section 93130.17(a)(3) and following, starting on page A-61, are extraordinarily complex and restrictive, stating:

*“(3) The proposed innovative concept must achieve emissions reductions that .... are early or in excess of: (1) any other state, federal or international rule, regulation, statute or any other legal requirement (including any requirement under a Memorandum of Understanding with a government entity); or (2) of an emissions reduction strategy identified in an AB 617 ..program...”*

*“(6) The proposed innovative concept must achieve emissions reductions that exceed any reductions other wise required by law, regulation or*

**MAERSK**

MAERSK LINE/ Maersk Agency USA  
9300 Arrowpoint Blvd.  
Charlotte NC 28273

www.maerskline.com  
tel: (704) 571-2693

*legally binding mandate, and that exceed any reductions that would otherwise occur in a conservative business-as-usual scenario"*

*"(12) No innovative concept shall be partially or fully funded with a public incentive program."*

These and other restrictions in this section appear to exclude participation by:

- Technologies or operational programs that have been part of a Technology Advancement program in California (e.g., SPBP CAAP), other states, the EU or elsewhere in the world.
- Any technology or program that might conceivably become part of an AB 617 plan that includes an Indirect Source Rule or other broadly defined community recommendation.

We also question how the applicant and CARB staff are to ensure that there are no disqualifying regulations or issues anywhere globally, and who will define the "conservative business-as-usual scenarios."

Recommendations:

- Section 93130.17 should be clarified and streamlined in order to achieve the needed reductions without discouraging innovation or participation in technology demonstrations and incentive programs in other parts of the world (e.g. Canada).
- In addition, it should be clearly stated that CARB's Low Carbon Fuel Credits are not considered to be incentives under this section.

## 6. Allocation of VIEs and TIEs: Section 93130.11

- a. Section 93130.11(a)(1) calls for reporting of vessel visits to CARB by January 7<sup>th</sup>. This seven-day period is inconsistent with the 30-day reporting required in other sections. Please clarify whether this report is a simple vessel call count or the full individual call reports for each vessel call that would normally be reported in 30 days.

We fully recognize and support the need for operators to know the VIE/TIE allocation as early as feasible in the year. However large vessels arriving on December 31 may have longer calls due to the holidays, so full data may not yet be available. Occasionally a vessel may still be alongside.

Recommendation: We suggest that either a simple actual vessel arrival/departure schedule be accepted for this purpose, or that preliminary

reports be allowed by Jan. 7<sup>th</sup> for calls after Dec. 7<sup>th</sup>, with updates allowed for those calls when full details are available.

- b. Section 93130.11(a)(1) also excludes calls made under Innovative concepts from being part of the VIE/TIE allocation. Provisions should be made for situations where the innovative concept is not available due to expiring approval or other technical or operational issues.
  - c. Section 93130.11(a)(3) has been aligned with the revised timeline. However the 5% values shown for vessel operators are not sufficient based on the analyses we submitted to CARB over the last year. This should be reviewed further during the period prior to implementation and specifically addressed in the interim review.
  - d. Section 93130.11(e): We appreciate the clarification that TIEs and VIEs can be used as needed by the owner.
7. **Liabilities:** The liability provisions in the new rule should be clarified before January 2023. The proposed rule still calls for joint and several liability for violating the control measure. This conflicts with the basic premise that the new rule should define clear requirements and responsibilities for each participant: ports, terminals, vessels and alternative compliance operators.

Thank you again for this opportunity to comment on the proposed regulatory language. We stand ready to work with CARB and other stakeholders over the next two years to identify and address practical issues and achieve a smooth transition.

Sincerely,

Lee Kindberg, Ph.D.

**Subject: Industry Coalition Comments on Second Supplemental 15-Day Notice, Proposed Regulation of Oceangoing Vessels At Berth**

Thank you for the opportunity to comment on the proposed At Berth Regulation. This coalition of industry stakeholders appreciates the opportunity to work with California Air Resources Board (CARB) staff during regulatory development on behalf of our maritime industry member companies and stakeholders, including oceangoing vessel operators, marine terminals, and ports.

The second 15-Day Notice provides for changes to the regulatory structure of the proposed At Berth Regulation and addresses some of the concerns that this coalition has raised during rule development. In particular, we believe changes to the effective date for proposed new rules to incorporate the existing regulated fleet from 2021 to 2023 and for restoring the originally proposed Ro/Ro effective date are steps in the right direction. These amendments provide some short-term continuity and an opportunity for future improvements. However, the latest 15-Day changes do not resolve numerous implementing, operational, and feasibility hurdles in this complex rule, and this coalition remains concerned that many of the foundational and technical issues that have been raised over the course of this rulemaking have not yet been addressed or responded to by the time of proposed rule adoption. Given these outstanding issues, if CARB adopts the rule as proposed, we envision that continued heavy lifting and future changes to this regulation will be necessary in order to facilitate a successful implementation.

**New Effective Date Provides an Opportunity to Address Challenges for Existing Regulated Fleets**

Industry stakeholders appreciate the revised effective date of 2023 for the application of the proposed rule to the existing regulated fleets. This date will allow all stakeholders an opportunity to continue to work with CARB staff to improve the rule structure and to ensure that any final rule will not penalize vessels, terminals and ports which have already committed to a shore power compliance pathway and are currently complying with the existing rule. This industry coalition remains concerned that the proposed rule as currently written and conceived cannot be successfully complied with even by vessels which are currently compliant with and have made required investments in shore power under the current regulation. Resolution of these concerns will only occur with concerted additional efforts to

create a robust fleet-averaging construct or other new avenues for compliance prior to 2023. Given the limited time, the industry stakeholders request that the Board direct staff to continue meetings with stakeholders to address and resolve outstanding issues regarding the current regulated fleet.

### **CARB Must Still Address Challenges for Expanding Regulation to Additional Fleets**

With respect to expansion of the scope of the existing rule, serious concerns remain regarding the feasibility and true cost-effectiveness of controlling tanker and Ro/Ro vessels. The opportunity to address these concerns regarding Ro/Ro vessels will benefit from the proposed 15-Day Changes to reapply the original date of implementation in this sector. However, it is imperative that CARB work with the impacted fleets to address outstanding concerns prior to commencement of the technical review period.

### **Interim Evaluation**

The text of the interim evaluation contained in the proposed regulation presupposes the feasibility of emission control technology for tanker and Ro/Ro vessels. The language should be clear that the interim evaluation will evaluate the feasibility of technology to control emissions successfully and cost-effectively from tankers and Ro/Ro vessels. The ability to package the existing technology to reduce emissions in exhaust streams in a manner that can safely operate on tanker and Ro/Ro vessels is an open question. The technology has a number of technical, safety, and operational constraints it must overcome. At the same time, any proposed system needs to also abide by Coast Guard, OSHA, and other regulatory requirements, while not being prohibitively expensive. The interim evaluation should be clear that it will evaluate all considerations that would impact the success of new control technologies.

With that in mind, the demonstrations proposed by CARB staff will be inadequate to inform the interim evaluation. First there are no proposed demonstrations to address Ro/Ro vessels. The configuration of Ro/Ro vessels make reaching the exhaust challenge an engineering challenge. The height and reach needed for such vessels will result in larger counterweights and increasing system weight. It is not known if such a system can be successfully placed on a barge or existing wharf structures. The only way to answer these questions is with a demonstration that must be completed before the interim evaluation is conducted. The proposed demonstration for tanker vessels will be unable to inform the interim evaluation. With a presentation date of December 2022, it is likely that the demonstration will not even be operating before CARB staff must prepare their evaluation and is not expected to be complete until long after the interim evaluation is complete. An interim evaluation that is not informed by a complete demonstration is mere speculation.

The interim evaluation should also address issues regarding rule implementation raised by stakeholders over the next two years. As work on implementation continues, it will be critical to resolve issues, including the sufficiency of TIEs/VIEs, incorporation of fleet averaging under Innovative Concepts or CARB Approved Emission Control Systems (CAECS), sufficient compliance pathways for non-frequent fliers, and other issues identified in this letter.

**Innovative Concepts**

This coalition appreciates proposed changes to the Innovative Concepts (IC) of the proposed regulation but believes that these changes remain insufficient. While increasing the term to five years does provide some additional certainty for select regulated parties to propose an innovative concept, it still fails to provide the long-term assurance necessary to make it a viable compliance pathway. A number of other changes should be considered to make the concept viable.

- A fleet averaging concept should be a defined path within the IC section. Fleet averaging, as a program whose parameters are known, should not be subject to unnecessary restrictions for new concepts. Given the known success of fleet averaging to reduce emissions, it is not necessary to create uncertainty by having a five-year term with extension subject to uncertain approval. In addition, concerns remain that at this time it is unknown how fleet averaging would be handled under the IC provisions and that CARB staff cannot describe or even assure that fleet averaging is consistent with all the requirements of the IC provisions.
- While IC must be “surplus” at the time of creation, CARB could revoke or decline to renew approval if the emission reduction became subject to regulation at a future date, or by any CARB-approved AB 617 Community Emission Reduction Plan. The IC section should be modified to allow IC reductions without this limitation.
- Limiting the location of IC emissions reductions only to “adjacent” communities and distances no greater than 3 nautical miles may have unintended consequences. Neither “adjacent” nor “community” are defined in the Proposed Regulation, so it is unclear how close an area would need to be in order to be deemed “adjacent,” and where the boundaries of that area would end. The IC section should be modified to encourage any project (adjacent or not) that would benefit the port and terminal communities.
- The IC section sets a single, one-time deadline for submitting a proposal. This implies that ICs will not be considered after December 1, 2021. The deadline should be removed and replaced with a process for IC plan review at any date such plans are submitted in the future. In addition, if IC will be used to facilitate fleet averaging, the ability to use fleet averaging should be available beyond 2021. Fleets will encounter different circumstances over the life of this regulation that may allow them to comply with the proposed regulation versus making use of a fleet average approach. New fleets may want to enter the California market after the 2021 deadline and this ensures they will be forever precluded from using fleet averaging. The original rule contained a similar fixed date requirement for alternative technologies, CARB staff eventually were forced to revise that through the use of an “Advisory”. As a result, we strongly recommend that IC applications be accepted continuously with the understanding that CARB needs a minimum lead time before an approved application becomes effective.
- The prohibition on public funding for ICs is too broad. Funding may come from different sources, including federal, other states, or other nations. In addition, such a prohibition would exclude demonstration projects. Fleets that are likely to engage in ICs, including fleet averaging,

are also likely to participate in demonstration projects sought by CARB or other air quality agencies. Being innovative should not prohibit technology advancement.

- Revocation of the IC plan provides for a 30-day notice. This is likely to be inadequate for an ocean carrier to transition to original provisions of the rule. The risk of a 30-day transition at the uncertain end of a five-year program is enough to prevent an ocean carrier opting to implement an IC. The IC section should include a nine-month transition period upon revocation of an IC plan.

### **Industry Grappling with the Effects of COVID-19**

The scale of the current crisis is unprecedented. The World Trade Organization (WTO) has estimated that global trade could decline up to 32% this year.<sup>1</sup> As a result of this crisis, the analyses on which this rule is based are out of date and no longer valid. The ISOR analysis is predicated on strong growth assumptions based on a number of forecasts. Questions about those assumptions were raised prior to the current crisis. For example, the ISOR analysis assumes that from 2016 (the inventory base year) through 2020 container cargo at the ports of Long Beach and Los Angeles would grow 4.5% per year. Last year (before the current crisis), the two ports declined 3.3%. Since the crisis, the decline has accelerated, with year-over-year declines in January (-5.1%), February (-16.9%), March (-19.7%), April (-11.4%), May (-13.7%), and June (-10.3%). For the first six months of the year, the two ports are down 12.5% over the same period last year. Before even considering the rest of the year, the current crisis means the emissions inventory contained in the ISOR is wrong. That gap only grows if the rest of 2020 is forecast based on WTO projections. By the end of this year, the baseline forecast used in the ISOR will overestimate cargo volumes by between 26% and 62%.

The economic impact of COVID-19 on the cruise industry is substantial. The suspension of operations will have a pronounced detrimental impact on families and communities globally. Of the 421,000 industry supported jobs in the United States, 12% are in California, yielding 49,369 jobs in The Golden State and generating \$3.26 billion in total wages and salaries.

In a similar fashion, fuel consumption has precipitously declined as a result of the crisis. With an unprecedented number of people filing jobless claims that need and demand for fuel has plummeted. Refinery demand will directly impact demand for liquid bulk vessels calling California ports. It is clear that the forecasts contained in the ISOR no longer represent a reasonable expectation of future activity of tankers in California.

The crisis is also forecast to impact auto sales in this country and globally. Decreased auto sales will translate into reduced Ro/Ro activity. The base case scenario has volumes declining from 2019 by 14%. In a worst-case scenario, volume declines would plunge 28% from 2019 levels. The Automotive from Ultima Media forecast auto sales slightly growing by the end of the decade, the proposed rule is based on a growth rate that would see Ro/Ro activity 83.5% higher than 2016 levels in the ports of Los Angeles

---

<sup>1</sup> [https://www.wto.org/english/news\\_e/spra\\_e/spra303\\_e.htm](https://www.wto.org/english/news_e/spra_e/spra303_e.htm)

and Long Beach by 2030 and 31.9% higher at the Port of Hueneme<sup>2</sup>. These numbers are not realistic or a reasonably foreseeable outcome of the current economic climate.

The estimates of benefits, emissions estimates, costs, cost-effectiveness, and health impacts, which presume the rate of growth contained in the ISOR, are now no longer valid. Even if growth were to immediately resume at levels assumed in the ISOR, cargo volumes and resulting activity will likely be millions of containers off from the cargo volume estimate.

**Projections and Analyses Must Be Revised**

During the June 25<sup>th</sup> hearing, CARB staff acknowledged that the COVID-19 crisis has impacted existing and future cargo volumes in California ports. Staff also stated that the current crisis will have disparate effects across the maritime industry, with the timeline to recovery being long. Even before the current crisis, this coalition submitted data demonstrating that the cargo and resulting emissions estimates were wrong. The crisis has amplified those errors. The derived data from the cargo forecasts has led to unreliable information presented in the updated emissions forecast. As stated in the letter on the first 15-Day Notice<sup>3</sup>, cargo volumes in 2020 for the ports of Los Angeles and Long Beach will be at least 26% below the values contained CARB’s data set. CARB staff has not addressed any of forecast issues raised in the prior letter. As a result, all dependent analyses, including rule emissions benefits, health benefits, CEQA review including the Statement of Overriding Considerations, and cost-effectiveness, will all be based on flawed data. CARB should re-evaluate baseline emissions, proposed emission reductions, health benefits, costs, and cost-effectiveness based on a revised forecast and assumptions.

5-1

**Fundamental Problems with Emissions Inventory Unresolved**

Even before addressing the changes brought about by the COVID-19 crisis, the emissions inventory has not addressed known problems as described in previous industry stakeholder comment letters. The inventory overestimates growth, resulting in a significant overestimation of the proposed rule’s emissions benefit. The inventory does not consider the emission reductions associated with Proposition 1B funding, requiring emission reductions of 90% under the existing rule – 10% more than the proposed rule. This results in the inappropriate attribution of emission reductions from existing requirements to the proposed rule. The emissions inventory also inappropriately caps emission reductions under the existing rule at 80%. Every vessel with a call greater than 15 hours will result in emission reductions greater than 80%. In San Pedro Bay, where calls greater than 100 hours are typical, emission reductions can exceed 97%. Section 93118.3(e)(4)(A) of the current regulation explicitly states that any vessel using grid power is assumed to reduce emissions 90%. Yet, no explanation or reason is given in the emissions inventory for capping emission reductions at 80%. The inventory must be updated to correct these issues.

5-2

CARB inventory staff have acknowledged these issues in a variety of phone calls and emails with stakeholders and have indicated that these issues will be resolved sometime this summer. That delay does a disservice to both the public and decisionmakers in understanding the benefits of the proposed rule changes.

<sup>2</sup> <https://ww3.arb.ca.gov/regact/2019/ogvatberth2019/apph.pdf>

<sup>3</sup> <https://www.arb.ca.gov/lists/com-attach/137-ogvatberth2019-UzpXP1w5UnQCd1lm.pdf>

**Timed Connection Requirement**

CARB staff has revised the one-hour limit on the connect and disconnect times for shore power to a two-hour connect time limit and one-hour disconnect time limit. While it is appreciated that the infeasibility of the one-hour requirement was acknowledged, a two-hour requirement is still arbitrary and not based on any evidence that it is safe or feasible. As we have said in previous letters, the existing rule permits multiple connection strategies, some of which will require more than one hour. More importantly, the shore power connection process requires individual people to manhandle heavy, high-voltage equipment and energize that equipment – sometimes in adverse weather conditions. Under no circumstances should that work be performed under a stopwatch. The two-hour requirement would likely be ineffective because any exceedance of the one-hour requirement would likely result in a safety exemption being sought, as having labor move faster handling high voltage equipment would be fundamentally unsafe.

CARB staff has still provided no basis on which it can be assumed that connection times can be consistently and safely accelerated. In fact, no data is available from CARB justifying the previous one-hour connection window or the new two-hour connection window.

**VIEs/TIEs**

This industry coalition remains concerned that the number of Vessel Incident Events (VIEs) and Terminal Incident Events (TIEs) are insufficient to ensure rule compliance. An analysis prepared by Starcrest Consulting Group previously submitted, demonstrated that there are insufficient VIEs/TIEs available to ensure compliance for known issues identified by CARB. As discussed earlier, VIEs/TIEs will be needed for unknown and unexpected changes in trade, vessel deployments or equipment failures and maintenance. If VIEs/TIEs are not increased, CARB will penalize ocean carriers and terminals for already known and unavoidable circumstances.

**Previous Comments Continue to Be Unaddressed**

Over the course of the rule development, this coalition, individually and collectively have submitted numerous comment letters<sup>4</sup> and all of those previous comments are incorporated herein by reference and they reserve all rights thereto. No direct responses have yet been provided. This coalition, again, renews its request that CARB staff review and respond to all substantive industry comments prior to Board consideration of the proposed regulation. Hundreds of pages of technical comments, data, and information have been provided to CARB during the entirety of this process. None of which has been agreed to, refuted, or rebutted. An iterative rulemaking process can only exist if CARB staff directly *responds* to the data submitted by stakeholders during the process, and the earlier in the process, the better the outcome for all.

**Conclusion**

The industry coalition looks forward to the opportunity to continue to improve the proposed rule and ensure successful and full compliance can be achieved. The rule in its current form remains problematic with a number of issues that will make full compliance unachievable at times, but these 15-Day Changes

5-3

<sup>4</sup> <https://www.arb.ca.gov/lispub/comm/bccommlog.php?listname=ogvatberth2019>

to move the effective date of the proposed rule to 2023 for the existing regulated fleet will allow stakeholders to continue to work with CARB staff to address these issues.

Sincerely,

***California Association of Port Authorities  
Pacific Merchant Shipping Association  
World Shipping Council***

## **World Shipping Council Comments**

to the

### **California Air Resources Board (CARB)**

on the

## **SECOND PROPOSED 15-DAY CHANGES TO THE CONTROL MEASURE FOR OCEAN- GOING VESSELS AT BERTH**

27 July 2020

The World Shipping Council (WSC) is a non-profit trade association that represents the liner shipping industry, which is comprised primarily of operators of containerships and roll-on/roll-off (ro-ro) vessels (including vehicle carriers). Together, WSC's members operate approximately 90% of the world's liner vessel services. Vessels operated by WSC members make frequent calls in California ports and WSC's members would be directly and substantially affected by the proposed rule.<sup>1</sup>

In addition to participating in CARB workshops, webinars and informal discussions, WSC has filed two rounds of formal, written comments on this proposed rule - on 9 December 2019 in response to the proposed control measure and on 1 May 2020 in response to the first round of 15-day changes to the proposed control measure. Each of our comments on the proposed rule has been accompanied by a specific and practical recommendation to address the issue discussed in the comment.

While we indeed appreciate the changes that CARB staff has made to the proposed control measure in response to WSC's comments, we note that few of our comments and recommendations on the first round of 15-day changes have been incorporated into the proposed rule. This concerns us because our comments contain policy and technical recommendations that will help ensure California's revised at-berth rules are practicable, provide a fair and reasonable compliance pathway for regulated vessels, and achieve the state's emissions reduction goals.

---

<sup>1</sup> A full description of the Council and a list of its members are available at [www.worldshipping.org](http://www.worldshipping.org).

Before turning to our detailed comments on the second round of 15-day changes, we offer the following higher-level comments on three elements of the proposed rule:

***Support for Adjusted Implementation Dates:*** WSC supports the proposed adjustment of the new rule's implementation dates. One of the main benefits of this adjustment is that it will put the infrastructure implementation and assessment steps in the correct order. Under the original proposed rule, port and marine terminal infrastructure plans to comply with the rule would not be due to CARB staff for review and approval until six months *after* the rule's requirements took effect. Under the proposed adjustment, CARB will be able to review and approve port and marine terminal infrastructure plans more than a year before the new implementation date takes effect for existing regulated vessels. The infrastructure plan information submitted to CARB by ro-ro ports and terminals will also be an important input to the December 2022 interim evaluation of control technologies for ro-ro auxiliary emissions.

***Need for Robust Ro-Ro Feasibility Analysis as Part of the Interim Evaluation:*** Under the proposed rule, CARB staff will publish in December 2022 the findings of an "interim evaluation" of emissions control technologies as well as landside infrastructure to control auxiliary emissions from ro-ro vessels and other classes of vessels that may in the future be subject to the rule. While we appreciate CARB staff's expansion of the scope of the interim evaluation to include shoreside infrastructure and information from port and terminal infrastructure plans, we strongly encourage CARB to expand the interim review so that it includes an assessment of the feasibility of controlling ro-ro auxiliary emissions, including a detailed cost versus benefit analyses based on updated ro-ro vessel visit, emissions and control technology information.

***Innovative Concepts Option:*** WSC supports the proposed extension of the period during which an innovative concept (IC) may be used as a compliance option from three to five years. Along with that change, we recommend that CARB eliminate the December 2021 IC application deadline and develop a process through which IC applications may be submitted on a rolling basis. This change would help encourage innovation to develop and deploy new emissions reduction technologies that may not be ready by December 2021. Finally, we wish to note that, in describing the IC option, CARB staff has indicated that it could be used by regulated vessel fleets to comply with the at-berth requirements. The provision, however, makes only an indirect reference to vessel fleets when it notes that visits made under an IC are not counted towards a fleet's vessel incident exceptions. We therefore recommend that CARB add a new sub-paragraph under the general requirements section (93130.17 (a)) that states that ICs may be used as a compliance option by regulated vessels, vessel fleets, ports and marine terminals.

WSC's additional technical comments and recommendations on CARB's second round of 15-day changes to the proposed control measure follow. Our comments are listed in the order that the issues appear in the proposed rule. Please direct any questions on these comments to Doug Schneider of the WSC staff at [dschneider@worldshipping.org](mailto:dschneider@worldshipping.org).

1. **Definitions** (Section 93130.2 (b)):

- a. **Ready to Work**: We recommend that CARB amend this definition by inserting the following after “netting down” and before “all”: “, the ramp is down and secure (if applicable), required shore side labor technicians are present, and”. These changes are needed to accommodate vessels equipped with ramps (which would not therefore use a gangway) and to note the presence of labor technicians that are essential to hooking the vessel up to shore power or to an alternative compliance method.
- b. **Visit**: We recommend that the words “at a different marine terminal” be inserted after the word “another” so shifts within a single marine terminal would not constitute a new vessel visit. To correspond to the above change, the words “at a different marine terminal” must also be inserted after the word “berth” in Section 93130.7(e)(4)(I).

2. **CARB Approved Emissions Control Strategy (CAECS) Operators** (Section 93130.5):

- a. **Requirements for CARB Approval** (Section 93130.5 (d)): Under current CARB at-berth regulations, LNG-fired auxiliary engines are treated as an approved control option. The proposed rule would, however, require time-consuming and costly testing of LNG-fired auxiliary engines before they may apply for CARB approval. This will discourage investments in a promising alternative to oil-fired auxiliaries. We therefore recommend that CARB retain the provisions in the current at-berth regulations that designate LNG-fired auxiliaries as an approved control option.

3. **Vessel Operator Requirements** (Section 93130.7):

- a. **Amendment to General Requirement Provision** (Section 93130.7): This section contains vessel checklist items that a commissioned shore power equipped ship cannot complete unless the terminal/port and/or CAECS operator complete their checklist obligations under the rule. Section 93130.7’s statement that “Any failure to perform any specific items in this section shall constitute a separate violation...” could thus be used to penalize a shore power equipped ship that could not complete its checklist items because the terminal/port or CAECS operator failed to meet its obligations. To correct this issue, we recommend that the second sentence in the opening paragraph of Section 93130.7 be replaced with:

*“Any failure to perform any specific items in this section shall constitute a separate violation for each calendar day that the failure occurs, except to the extent a vessel operator cannot perform any requirement due to (1) a terminal and/or port’s failure to comply with the portions of this Control Measure that impose requirements upon terminals and/or ports, and/or (2) a CARB Approved Emission Control Strategy Operator’s failure to comply with the portions of this Control Measure that impose requirements upon CARB Approved Emission Control Strategy Operators.”*

- b. **Amendment to Shore Power Provision** (Section 93130.7 (a)): Changes are needed to eliminate ambiguity and prevent this provision from being used to dictate to vessels on which side they must be able to plug in to shore power. We recommend that 93130.7 (a) be replaced with:

*“(a) Shore power requirements for at berth emissions reductions.*

*Vessel operators with shore power vessels that have been commissioned by the terminal (or port) at which the vessel will call (or deemed compatible based on a previous commissioning) shall plug in to shore power on each visit to the terminal. Commissioning of vessel shore power equipment should be based on the following technical standards: IEC/ISO/IEEE 80005-1/80005-2 and IEC 62613-1.”*

- c. **Expansion to Ro-Ro Vessels** (Section 93130.7(b)):

WSC continues to have significant concerns with CARB’s proposal to expand the applicability of the at berth regulations to ro-ro vessels (including vehicle carriers). Ro-ro vessels make infrequent and very short port calls in California. Over the course of a year, each vessel in a ro-ro fleet may call only 2 or 3 times and for a very short period of time. This means the CARB’s at berth emissions requirement would become applicable to all ro-ro vessels that may at some point in a given year call California. The problem is that ro-ro vessels and the terminals they call have limited viable or cost-effective compliance options.

CARB is predicating its regulation of ro-ro auxiliary emissions on the premise that barge or shore-based emissions capture and control technologies will become a viable and practicable emissions control option. Experience to date with the existing barge-based capture and control service providers has demonstrated that those services are often unreliable, are exceedingly costly, and would pose substantial operational and safety problems for ro-ros. For example, the systems cannot be used in windy weather, cannot always reach ro-ro stacks (which may be 40 meters laterally and 40 meters above the waterline), and often prevent simultaneous alongside bunkering operations. Shore-based emissions capture systems may be better able to reach ro-ro stacks, but obstruct shoreside cargo operations, may not be useable in windy weather and exceed the load bearing capabilities at many of the terminals in California where ro-ro vessels must call.

6-1

CARB has estimated that the control cost per ton of emissions reduced for ro-ro vessels is \$53,600. Even using that cost estimate, which we believe is low<sup>2</sup>, it is worth

---

<sup>2</sup> Starcrest Consulting Group, LLC, published in December 2019 a ro-ro cost analysis study for PMSA and the Ports of Los Angeles and Long Beach. The study estimated that the costs to control ro-ro auxiliary emissions ranges from approximately \$115,000 to \$200,000 per weighted ton of emissions. A copy of this study may be found in the CARB at-berth docket at: <https://www.arb.ca.gov/lispub/comm/bccommlog.php?listname=ogvatberth2019>.

noting for comparison that CARB estimated that the control cost per ton of emissions reduced for containerships is \$13,500. When asked what cost-benefit threshold was used to decide which classes of vessels to regulate and which not to regulate, CARB staff reported that there is no threshold and that the decision to regulate ro-ro emissions was based simply on aggregate emissions. There has been no considered analysis of the costs and benefits of regulating ro-ro auxiliary emissions. We also note that ro-ro auxiliary emissions occur in distinctly different geographic locations, where their impacts and the related cost-benefit analyses for controlling those emissions may be quite different.

In summary, CARB’s proposal fails to demonstrate that a cost-effective and practicable pathway exists for controlling ro-ro vessels’ auxiliary emissions, fails to address the major operational, safety and cost issues emissions capture systems pose for ro-ro vessels and fails to account fully for the emissions generated by emissions capture systems. Compelling ro-ro carriers to try to comply with the rule using the operationally impractical, complex and costly emissions capture systems on the market is not appropriate and will delay the adoption and benefits of more practicable zero-emission technologies that still need to be developed.

WSC therefore recommends that CARB not proceed with the proposal to regulate ro-ro auxiliary emissions and instead monitor ro-ro emissions and the ongoing development of technologies that may in the future provide a viable and economically achievable compliance option for these vessels.

d. **Vessel Compliance Checklists** (Section 93130.7 (e)):

- **Shore Power Connection Time:** While CARB proposes to modify § (3) (A) to require vessels to begin using shore power or another CAECS within two hours after “Ready to Work”, a substantial number of arriving vessels would still be unable to meet this requirement. Establishing shore power connections must be done safely by longshore technicians, who may not be immediately available given their other extensive responsibilities. Unreasonably short time limits for connecting high-voltage systems could pose safety risks to workers, result in unnecessary damage to the equipment, and subject a substantial percentage of compliant vessel calls to noncompliance for tasks the vessel cannot control. We therefore recommend that vessels be required to begin using shore power or another CAECS within three hours after “Ready to Work”.
- **Shore Power Disconnection Time:** § (3) (B) would require vessels to cease using shore power no sooner than one hour before “Pilot on Board”. There will be situations in which this is not a practicable disconnection deadline for ocean carriers because of delayed vessel departures due to weather or vessel traffic or if labor unplugs the vessels early due to their own shift schedules. We therefore recommend that the shore power disconnection time be no sooner than two hours before “Pilot on Board”.

6-2

- **Post-Visit Reporting:** We support CARB’s proposal in § (4) to require reporting of information for each visit to a California terminal within 30 days of vessel departure instead of the previously proposed 7 days of vessel departure. We recommend that CARB develop an online system/dashboard into which each vessel (and terminal) operator could upload its post-visit reports. The dashboard should provide each operator with an updated snapshot of its compliance as well as VIE/TIE allowances versus usage and other relevant metrics for the designated fleet.

**4. Terminal Operator Requirements** (Section 93130.9):

- a. **General Requirement:** We support CARB’s decision to include in the proposed rule clear and appropriate obligations for marine terminals and ports to provide the shore side infrastructure to connect ships to at-berth power and to connect commissioned ships in a timely manner when they call. These are functions that commercial ships cannot themselves perform and lack commercial power to require. Including these requirements in the regulation will establish balanced obligations for ships and the terminals they call and will set clear expectations regarding what ports and marine terminals will need to do to fulfill their obligations under the rule.
- b. **Commissioning** (Section 93130.9 (a)(2)): This proposed change could be read as allowing ports or terminal operators to dictate on which side vessels seeking to have their installed shore power systems commissioned must connect. Vessel shore power equipment is designed to enable the vessel to connect to shore power on one, but not both, sides and the vessel has no ability to quickly switch the equipment to the other side. We strongly recommend that this provision be replaced with the following: “(2) *The port or terminal is responsible for commissioning vessels fitted with installed shore power equipment.*”

**5. VIEs and TIEs** (Section 93130.11):

- a. **Exclusion of Innovative Concept Visits in VIE and TIE Allocations** (Section 93130.11 (a)): We support the allocation of VIEs based on company vessel fleets and support CARB’s proposal to exclude from the annual VIE allocations visits made under an innovative concept covered under Section 93130.17 of the rule.
- b. **VIE and TIE Rates** (Section 93130.11 (b)): The proposed VIE allocation (5%) needs to be increased to account for the fact that the rule will require all containerships and refrigerated cargo vessels to use at-berth power. We anticipate, based on historical compliance data, that more than 5% of vessel fleets will be unable to comply due to onboard equipment problems, the need to rotate vessels into and out of California services for required surveys and dry-dockings, and due to unpredictable commercial demands that may require shipping companies to deploy or phase-in non-commissioned vessels to meet U.S. import and export trade needs. With the above considerations in mind, we recommend that CARB increase the VIE allocation for the first three years after implementation to 10 percent per year.

- c. **Requests for Additional VIEs and TIEs** (Section 93130.11 (c)): Since vessel operators may encounter situations that warrant additional VIEs that could not be anticipated by 1 December, we recommend that CARB modify 93130.11 (c) by inserting the following after the third full sentence: “(Note: CARB staff will consider, and respond within 60 calendar days, to written requests for additional VIE and TIEs submitted at any time during the year)”.
  - d. **VIE and TIE Expiration** (Section 93130.11 (d)): To provide more flexibility, particularly to address chaotic market conditions, we recommend that CARB allow companies to carry over any unused TIEs or VIE until June 30 of the year after they were granted.
6. **Terminal and Port Plans** (Section 93130.14): WSC believes that there would be value in explicitly articulating in the revised rule that port and terminal plans should include, among other things: a) appropriate changes to existing infrastructure design (e.g., inadequate electrical sub-station/electrical vault configurations); b) expansion of existing electrical infrastructure in container ports to accommodate to enable all shore power equipped container ship calls to be accommodated through shore-side power; and c) that approved plans include a realistic timeframe for design and construction consistent with the final regulatory dates promulgated in the final rule.
7. **Interim Evaluation of New Control Technologies** (Section 93130.14 (d)): Please see our comments and recommendations on page 2 of this document.
8. **Remediation Fund Users** (Section 93130.15): We recommend that CARB expand the list of circumstances in which vessel operators may use the remediation fund to include vessels that make infrequent calls to California ports (e.g. less than 3 calls per year). This is a logical regulatory approach for addressing infrequent calling vessels (e.g. vessels rotated in to California to address increased demand or “extra loaders” brought in to ease port congestion) because it would enable the vessels to have a compliance option if CAECS operators are not available or operational for a particular visit.
9. **Innovative Concept Compliance Option** (Section 93130.17): Please see our comments and recommendations on page 2 of this document.
10. **Summary of Responsibilities** (Section 93130.18): The last row in Table 6 suggests that in the case of a CAECS equipment failure or failure to perform, the vessel, terminal and the CAECS operator would be held responsible. This is not appropriate and creates ambiguity with respect to compliance. The vessel operator has no ability to control the performance or maintenance of a CAECS operator. Under this rule, CAECS operators will be CARB approved, regulated entities that are subject to penalty action for noncompliance. If a CAECS operator fails to meet its obligations under the rule, the CAECS operator alone should be subject to penalty action or an exception (e.g. if the equipment failure was due to a safety issue). We

therefore recommend that “vessel” and “terminal” be removed from the list of responsible parties in Table 6 when a CAECS has an equipment failure or failure to perform.

**Subject: Cruise Lines International Association (CLIA) Comments on Second Supplemental 15-Day Notice - Proposed Regulation of Oceangoing Vessels At Berth**

Dear Clerk:

Thank you for the opportunity to comment on the proposed At Berth Regulation Second 15-Day Changes. CLIA on behalf of the cruise lines that visit California ports appreciates the opportunity over the last few years to work with California Air Resources Board members and staff directly and through the Industry Coalition during regulatory development of this rule.

The Second 15-Day Notice provides for changes to the regulatory structure of the proposed At Berth Regulation and includes one very important change requested by CLIA and the Industry Coalition: the ability for the currently regulated fleet to continue to use the existing fleet average rule for at least an additional two years from 2021 to 2023. These amendments provide the ability for cruise line fleets to continue in compliance with the existing shore power rule as has been the case since 2014 when the original rule went into effect, and which is particularly important given the extreme impacts the COVID-19 pandemic has had on cruise line operations. Importantly, it also provides an opportunity for discussions over the next two years to address issues that remain to be adequately addressed in the new rule for fleets. Those issues are discussed below. In addition, CLIA supports the Industry Coalition Second Supplemental 15-Day Notice comments.

**CLIA SUPPORTS THE NEW EFFECTIVE DATE TO ALLOW TIME TO ADDRESS ONGOING CONCERNS WITH THE NEW RULE AND DEVELOP OPTIONS FOR FLEETS**

As previous comments stated, CLIA and the industry coalition have serious concerns with the proposed rule, particularly that it contains provisions that will result in noncompliance even though these existing regulated ships have been in compliance since the existing shore power rule was put in place. CLIA supports the delay of implementation of the new regulation until January 1, 2023 for existing regulated fleets and welcome using this time to continue meetings with staff to discuss concerns that remain to be resolved in the new regulation, and determine solutions that meet the needs of fleets and allow them to remain in compliance.

**CLIA REQUESTS STAFF DEVELOP SUFFICIENT COMPLIANCE PATHWAYS FOR NON-FREQUENT FLIERS TO AVOID REQUIRING THESE VESSELS TO CONTINUE TO PULL CALLS OUT OF CALIFORNIA**

The cruise lines request that CARB staff work over the next year with cruise lines and other stakeholders that have non-frequent fliers to find an alternative compliance option for vessels that rarely or unexpectedly visit California ports. The goal will be to allow cruise vessels to continue to make 4 or fewer calls in California without being forced to either put in shore power that is rarely used or eliminate calls in California ports to stay in compliance. CARB has unfortunately classified these non-frequent fliers as “unregulated” because they are exempted from the existing At Berth rule.

Out of hundreds of cruise vessels worldwide, only a limited number continually visit California and are equipped with shore power. Cruise vessels that are visiting California ports only once every few years cannot support the huge investment in shore power and ongoing maintenance required, but unfortunately also cannot use the existing CARB-approved alternative compliance option. In addition, although the draft rule did change the implementation date for non-frequent fliers to 2023, unlike fleets, that deferral did not give these global and transition cruises an option but to pull calls out of California. The cruise sector sets itineraries years in advance and the previously pending 2021 regulations already forced a reduction in the number of planned calls in 2021 and 2022 from “nonfrequent flier” ships.

Without clarity on the 2023 regulation sometime in the next year, these vessels will have the same result in 2023 and 2024. While the extension of the current regulation for the regulated fleet is helpful, losing the ability of non-frequent fliers to call on

California ports during this two-year extension would detrimentally impact these lines as well as prohibit many additional calls to California ports, specifically those transiting to and from Alaska. The more specialized world cruises and relocating cruise vessels may visit once every two to four years and only a few ports each visit, using entirely different cruise ships each time. This means that these vessels would be able to use these \$2 million systems only 8-16 hours every one or two years.

A different flexible alternative is critical for these vessels to avoid displacing this trade that though fewer in overall numbers are still financially significant to impacted California ports that will lose additional calls. It is also important to note that the ISOR and SRIA do not properly analyze the possibility of future vessel diversions as well as those that have already occurred, and their economic impact.

**CLIA SUPPORTS MOVING UP PORT AND TERMINAL PLAN DUE DATES SO THEY ARE IN PLACE PRIOR TO 2023, BUT ARE CONCERNED THAT THERE ARE NO DATES BY WHICH PLANNED INFRASTRUCTURE MUST BE IN PLACE**

CLIA appreciates that the rule has been amended to require port and terminal plan due dates by December 1, 2021, before 2023. However, assurances should be included in the rule that shoreside shore power infrastructure will be available to meet the increased port calls required beginning in 2023.

**CLIA REQUESTS THAT THE FOCUS OF THE INTERIM EVALUATION BE EXPANDED**

The interim evaluation due now December of 2022 should be specifically expanded to address issues regarding rule implementation raised by stakeholders. As work on implementation continues, it will be critical to resolve issues, including incorporation of fleet averaging under Innovative Concepts or CARB Approved Emission Control Systems (CAECS), finalizing sufficient compliance pathways for non-frequent fliers, and addressing other issues identified in this letter, previous CLIA comments, and the Industry Coalition letters.

**CLIA REQUESTS THAT LIABILITY BE CLARIFIED**

By 2023, the liability provisions in the new rule should be clarified. The new proposed rule still requires joint and several liability for violating the control measure, which conflicts with specific liability/responsibility for ports, terminals, vessels and alternative compliance operators in other sections of the rule.

**CLIA'S PREVIOUS COMMENTS STILL APPLY REGARDING UNRESOLVED CONCERNS WITH THE NEW PROPOSED RULE**

There remain a number of comments previously submitted by CLIA that are unresolved with the new rule:

- the new rule remains extremely complex and doesn't work well for fleet-based companies - which has the potential to place vessels in compliance since 2014 in noncompliance;
- an alternative compliance option to shore power should be available for vessels that cannot use the only existing CARB-approved alternative compliance option;
- the remediation fund hourly amount of \$12,000 per hour is punitive for cruise vessels and acts like a major penalty usually reserved for willful or intentional violations – in addition, a more reasonable per hour rate should also be considered as a compliance option for non-frequent fliers;
- a phase-in period should be allowed for low activity terminals suddenly being added to the rule based on activity;
- ongoing issues remain with the checklist, the timed connection requirement, and compliance decisions being made long after the vessel leaves port leaving vessels unsure of possible violations until after a California port visit.

Again, thank you for your consideration of these comments.

Sincerely,

Donald Brown  
VP, Maritime Policy  
Cruise Lines International Association

**Subject: OGV At Berth -- PMSA Comments on Second Supplemental 15-Day Notice**

On behalf of its ocean carrier and marine terminal operator member companies, the Pacific Merchant Shipping Association (PMSA) appreciates the opportunity to comment on the latest version of the proposed At Berth Regulation for Oceangoing Vessels. The second 15-Day Notice provides for changes to the regulatory structure of the proposed At Berth Regulation that address some of the concerns that PMSA has raised during rule development that result from the elimination of the current regulation and its replacement with an entirely new enforcement regime.

PMSA and its members are proud of our record of compliance with the current Vessel At Berth regulation and the significant emissions reductions that we have achieved from our operations. Changing the effective date for the existing regulated fleet from 2021 to 2023 in the proposed rule validates this success and will maintain the current regulation for two more years without any degradation in emissions controls. This is beneficial in that it will forestall unnecessary rule change impacts, provide regulatory and enforcement compliance continuity for the existing regulated fleet, and give all stakeholders and CARB an additional opportunity for making improvements to the proposed new measure. PMSA remains concerned that many of the issues that have been raised during this rulemaking have not yet been addressed or even responded to substantively, and we would respectfully request that the Board commit to taking this additional time to address these issues and concerns prior to the implementation of a new regulatory regime in 2023.

PMSA has been pleased to work with CARB staff for many years on the implementation and enforcement of the current regulation and on addressing the potential changes in this proposed measure. We incorporate herein by reference all of our previous comments, reports, and submissions during the informal rulemaking and formal rulemaking periods, including the technical evaluation work of third-party consultants regarding the proposed rule. We are also proud to work with a coalition of diverse cross-industry stakeholders who have been working to create a cost-effective and technologically feasible set of conditions for rule expansion for the past several years, including a comprehensive alternative proposal. PMSA continues to associate itself with the comments of the industry coalition consisting of CAPA, CLIA, PMSA, WSPA and WSC.

**New Effective Date Provides an Opportunity**

PMSA is concerned that the proposed rule cannot be successfully complied with by many fleets which have invested significant resources into a working shore power system and are plugging in at ports and terminals which are similarly equipped and compliant with the current regulation. These concerns are amplified given the realities and uncertainties present in the maritime industry. Therefore, the revised effective date of 2023, which allows for these fleets to continue to operate under current law, is appreciated. This date will allow PMSA and its members to continue to work with CARB staff to improve the rule structure without risking temporal non-compliance for shore power equipped vessels. In addition, serious concerns remain regarding the feasibility and true cost-effectiveness of controlling tanker and Ro/Ro vessels and this framework should provide benefits for those fleets as well.

**US EPA Waiver Required for 2023 Implementation**

CARB sought and was granted the waiver from USEPA for the existing At Berth regulations which implement emissions standards applicable to the running of auxiliary engines while at berth in California's ports. (76 FR 77515) This waiver was granted after previous auxiliary engine emissions standards were determined to be unenforceable by ARB without the prior issuance of a US EPA §209(e)(2) waiver and after objection to the waiver by PMSA. See *Pacific Merchant Shipping Association v. Goldstene*, 517 F.3d 1108 (9th Cir., 2008). The US EPA waiver process is one component of the Clean Air Act that ensures the preservation of the current and previously adopted regulatory structure in a uniform manner nationwide, as an alternative emissions standard over and above or in addition to a US EPA standard, and that the adoption or change to any existing uniform rule is completed in the best interests of the currently regulated vessel fleets, CARB, and the entire United States. More importantly, regulations for vessels at berth, including specifically any newly promulgated emissions standards, are legally unenforceable without the provision of a new waiver.

Now that CARB has set the effective date for changes to the existing At Berth Rule in 2023, it should clearly and affirmatively lay out its schedule for seeking an obtaining a new waiver for the new At Berth Regulation from the U.S. Environmental Protection Agency, or it should create a clear compliance pathway for currently regulated vessel fleets which is consistent with the existing waiver.

**Proposed Rule's Joint & Several Liability and Indirect Source Approach is Unnecessary**

An indirect source rule is a regulation which assigns a liability and responsibility to a facility to reduce indirect mobile source emissions which that facility does not control, when the mobile source can be directly regulated to reduce emissions through a traditional emissions standard, engine standard, or other in-use standard.

We are concerned that many of these hallmarks are present in the proposed control measure when they were successfully avoided in the current regulation. Ports and marine terminals at present are responsible for the provision of shoreside power infrastructure and operational support and manning under the current rule, and that will not change under the proposed rule. These entities can be held accountable for such responsibilities, but they cannot be held liable for an emissions standard violation

by an off-road engine on a vessel over which they have no control. This proposal seeks to do just that by establishing a novel and unnecessary Joint & Several Liability measure for vessel emissions.

Assigning a vessel's emissions standard liability to a port or marine terminal must be avoided. The creation of third-party liability for vessel emissions for a marine terminal is just as misplaced as trying to hold a vessel operator responsible for the actions of a marine terminal operator once at berth. These should all be treated as independent bases of responsibility and given independent measures of reporting and review. PMSA has proposed multiple bases upon which these liabilities may be established and believes that continued investment in compliance can be maintained without the establishment of a new liability regime.

#### **Projections and Analyses Must Be Revised**

During the June 25<sup>th</sup> hearing, CARB staff acknowledged that the COVID-19 crisis has impacted existing and future cargo volumes in California ports. Staff also stated that the current crisis will have disparate effects across the maritime industry, with the timeline to recovery being long. Even before the current crisis, data was submitted demonstrating that the cargo and resulting emissions estimates were wrong. The crisis has amplified those misapplications and projections.

The derived data from the cargo forecasts has led to unreliable information presented in the updated emissions forecast. As stated in the letter on the first 15-Day Notice<sup>1</sup>, cargo volumes in 2020 for the ports of Los Angeles and Long Beach will be at least 26% below the values contained CARB's data set. CARB staff has not addressed any of forecast issues raised in the prior letter.

More information continues to become available demonstrating the problems attendant to the existing CARB forecasts and inventories. PMSA recently released an analysis<sup>2</sup> that provides the most recent annual data on the loss of containerized trade market share experienced by U.S. West Coast ports, including Los Angeles, Long Beach, and Oakland in recent years. This analysis demonstrates the accelerating market share erosion of California ports. As a result, all dependent analyses, including rule emissions benefits, health benefits, CEQA review including the Statement of Overriding Considerations, and cost-effectiveness, will all be based on flawed data. CARB should re-evaluate baseline emissions, proposed emission reductions, health benefits, costs, and cost-effectiveness based on a revised forecast and assumptions.

#### **Interim Evaluation**

The text of the interim evaluation contained in the proposed regulation presupposes the feasibility of emission control technology for Ro/Ro vessels. The language should be clear that the interim evaluation will evaluate the feasibility of technology to control emissions successfully and cost-effectively from

<sup>1</sup> <https://www.arb.ca.gov/lists/com-attach/137-ogvatberth2019-UzpXP1w5UnQCd1Im.pdf>

<sup>2</sup> <https://www.pmsaship.com/wp-content/uploads/2019/12/Briefing-Paper-Loss-of-Market-Share-at-U.S.-West-Coast-Ports.pdf>

Ro/Ro vessels since there is no existing technology to reduce emissions in exhaust streams in a manner that can safely operate on tanker Ro/Ro vessels in operation. The technology which is currently in demonstration has a number of technical, safety, and operational constraints it must overcome. At the same time, any proposed system needs to also abide by Coast Guard, OSHA, and other regulatory requirements, while not being prohibitively expensive.

The interim evaluation should be clear that it will evaluate all considerations that would impact the success of new control technologies, including the configuration of Ro/Ro vessels, which make reaching the exhaust an engineering challenge. The only way to answer these questions is with a demonstration that must be completed before the interim evaluation is conducted. With a presentation date of December 2022, it is likely that the demonstration will not even be operating before CARB staff must prepare their evaluation and is not expected to be complete until long after the interim evaluation is complete. An interim evaluation that is not informed by a complete demonstration is mere speculation.

The interim evaluation should also address issues regarding rule implementation raised by PMSA and other maritime industry stakeholders over the next two years. As work on implementation continues, it will be critical to resolve issues, including the sufficiency of TIEs/VIEs, incorporation of fleet averaging under Innovative Concepts or CARB Approved Emission Control Systems (CAECS), sufficient compliance pathways for non-frequent fliers, and other issues identified in this letter.

#### **Industry Grappling with the Effects of COVID-19**

The scale of the current crisis is unprecedented. The World Trade Organization (WTO) has estimated that global trade could decline up to 32% this year.<sup>3</sup> As a result of this crisis, the analyses on which this rule is based are out of date and no longer valid. The ISOR analysis is predicated on strong growth assumptions based on a number of forecasts. Questions about those assumptions were raised prior to the current crisis. For example, the ISOR analysis assumes that from 2016 (the inventory base year) through 2020 container cargo at the ports of Long Beach and Los Angeles would grow 4.5% per year. Last year (before the current crisis), the two ports declined 3.3%. Since the crisis, the decline has accelerated, with year-over-year declines in January (-5.1%), February (-16.9%), March (-19.7%), April (-11.4%), May (-13.7%), and June (-10.3%). For the first six months of the year, the two ports are down 12.5% over the same period last year. Before even considering the rest of the year, the current crisis means the emissions inventory contained in the ISOR is wrong. That gap only grows if the rest of 2020 is forecast based on WTO projections. By the end of this year, the baseline forecast used in the ISOR will overestimate cargo volumes by between 26% and 62%.

The estimates of benefits, emissions estimates, costs, cost-effectiveness, and health impacts, which presume the rate of growth contained in the ISOR, are now no longer valid. Even if growth were to immediately resume at levels assumed in the ISOR, cargo volumes and resulting activity will likely be millions of containers off from the cargo volume estimate.

<sup>3</sup> [https://www.wto.org/english/news\\_e/spra\\_e/spra303\\_e.htm](https://www.wto.org/english/news_e/spra_e/spra303_e.htm)

**Innovative Concepts**

PMSA appreciates proposed changes to the Innovative Concepts (IC) of the proposed regulation but believes that these changes remain insufficient. While increasing the term to five years does provide some additional certainty for select regulated parties to propose an innovative concept, it still fails to provide the long-term assurance necessary to make it a viable compliance pathway. A number of other changes should be considered to make the concept viable.

- A fleet averaging concept should be a defined path within the IC section. Fleet averaging, as a program whose parameters are known, should not be subject to unnecessary restrictions for new concepts. Given the known success of fleet averaging to reduce emissions, it is not necessary to create uncertainty by having a five-year term with extension subject to uncertain approval. In addition, concerns remain that at this time it is unknown how fleet averaging would be handled under the IC provisions and that CARB staff cannot describe or even assure that fleet averaging is consistent with all the requirements of the IC provisions.
- While IC must be “surplus” at the time of creation, CARB could revoke or decline to renew approval if the emission reduction became subject to regulation at a future date, or by any CARB-approved AB 617 Community Emission Reduction Plan. The IC section should be modified to allow IC reductions without this limitation.
- Limiting the location of IC emissions reductions only to “adjacent” communities and distances no greater than 3 nautical miles may have unintended consequences. Neither “adjacent” nor “community” are defined in the Proposed Regulation, so it is unclear how close an area would need to be in order to be deemed “adjacent,” and where the boundaries of that area would end. The IC section should be modified to encourage any project (adjacent or not) that would benefit the port and terminal communities.
- The IC section sets a single, one-time deadline for submitting a proposal. This implies that ICs will not be considered after December 1, 2021. The deadline should be removed and replaced with a process for IC plan review at any date such plans are submitted in the future. In addition, if IC will be used to facilitate fleet averaging, the ability to use fleet averaging should be available beyond 2021. Fleets will encounter different circumstances over the life of this regulation that may allow them to comply with the proposed regulation versus making use of a fleet average approach. New fleets may want to enter the California market after the 2021 deadline and this ensures they will be forever precluded from using fleet averaging. The original rule contained a similar fixed date requirement for alternative technologies, CARB staff eventually were forced to revise that through the use of an “Advisory”. As a result, we strongly recommend that IC applications be accepted continuously with the understanding that CARB needs a minimum lead time before an approved application becomes effective.

- The prohibition on public funding for ICs is too broad. Funding may come from different sources, including federal, other states, or other nations. In addition, such a prohibition would exclude demonstration projects. Fleets that are likely to engage in ICs, including fleet averaging, are also likely to participate in demonstration projects sought by CARB or other air quality agencies. Being innovative should not prohibit technology advancement.
- Revocation of the IC plan provides for a 30-day notice. This is likely to be inadequate for an ocean carrier to transition to original provisions of the rule. The risk of a 30-day transition at the uncertain end of a five-year program is enough to prevent an ocean carrier opting to implement an IC. The IC section should include a nine-month transition period upon revocation of an IC plan.

**Fundamental Problems with Emissions Inventory Unresolved**

Even before addressing the changes brought about by the COVID-19 crisis, the emissions inventory has not addressed known problems as described in previous industry stakeholder comment letters. The inventory overestimates growth, resulting in a significant overestimation of the proposed rule’s emissions benefit. The inventory does not consider the emission reductions associated with Proposition 1B funding, requiring emission reductions of 90% under the existing rule – 10% more than the proposed rule. This results in the inappropriate attribution of emission reductions from existing requirements to the proposed rule. The emissions inventory also inappropriately caps emission reductions under the existing rule at 80%. Every vessel with a call greater than 15 hours will result in emission reductions greater than 80%. In San Pedro Bay, where calls greater than 100 hours are typical, emission reductions can exceed 97%. Section 93118.3(e)(4)(A) of the current regulation explicitly states that any vessel using grid power is assumed to reduce emissions 90%. Yet, no explanation or reason is given in the emissions inventory for capping emission reductions at 80%. The inventory must be updated to correct these issues.

CARB inventory staff have acknowledged these issues in a variety of phone calls and emails with stakeholders and have indicated that these issues will be resolved sometime this summer. That delay does a disservice to both the public and decisionmakers in understanding the benefits of the proposed rule changes.

**Timed Connection Requirement**

CARB staff has revised the one-hour limit on the connect and disconnect times for shore power to a two-hour connect time limit and one-hour disconnect time limit. While it is appreciated that the infeasibility of the one-hour requirement was acknowledged, a two-hour requirement is still arbitrary and capricious and not based on any evidence that it is safe or feasible. As we have said in previous letters, the existing rule permits multiple connection strategies, some of which will require more than one hour. More importantly, the shore power connection process requires individual people to manhandle heavy, high-voltage equipment and energize that equipment – sometimes in adverse weather conditions. Under no

9-3

9-4

circumstances should that work be performed under a stopwatch. The two-hour requirement would likely be ineffective because any exceedance of the one-hour requirement would likely result in a safety exemption being sought, as having labor move faster handling high voltage equipment would be fundamentally unsafe.

9-4  
cont.

CARB staff has still provided no basis on which it can be assumed that connection times can be consistently and safely accelerated. In fact, no data is available from CARB justifying the previous one-hour connection window or the new two-hour connection window.

### **VIEs/TIEs**

PMSA is concerned that the number of Vessel Incident Events (VIEs) and Terminal Incident Events (TIEs) are insufficient to ensure rule compliance. An analysis prepared by Starcrest Consulting Group previously submitted, demonstrated that there are insufficient VIEs/TIEs available to ensure compliance for known issues identified by CARB. As discussed earlier, VIEs/TIEs will be needed for unknown and unexpected changes in trade, vessel deployments or equipment failures and maintenance. If VIEs/TIEs are not increased, CARB will penalize ocean carriers and terminals for already known and unavoidable circumstances.

### **Previous Comments Continue to Be Unaddressed**

PMSA has submitted numerous letters under its own name and in cooperation with other maritime stakeholders<sup>4</sup>. Those comments are incorporated herein by reference. This includes numerous technical comments which have not been formally addressed or responses provided. We request that CARB staff review and respond to all industry comments before Board consideration of the proposed regulation. The rulemaking process should be an iterative process in order to develop a rule that achieves air quality goals in a manner that creates the least burden and at the lowest cost. The purposes of the informal rulemaking period should be to ensure stakeholders have an opportunity to lay out issues *and* have those issues responded to. Hundreds of pages of comments, data, and technical information have been provided to CARB, all of which are awaiting a response. An iterative rulemaking process can only exist if CARB staff *responds* to the data submitted by stakeholders during the process.

---

<sup>4</sup> <https://www.arb.ca.gov/lispub/comm/bccommlog.php?listname=ogvatberth2019>

**Conclusion**

While the current form of the proposed rule remains problematic with a number of issues that will make full compliance unachievable at times, the fact that the effective date of the proposed rule has now been set for 2023 will allow all PMSA to continue to work with CARB staff to address these issues. PMSA looks forward to opportunity to continue to improve the proposed rule and ensure successful and full compliance can be achieved.

Sincerely,

A handwritten signature in blue ink that reads "Thomas Jelenić". The signature is written in a cursive style with a large initial 'T'.

Thomas Jelenić  
Vice President

# SAN PEDRO BAY PORTS

# CLEAN AIR ACTION PLAN

July 26, 2020

Richard Corey  
California Air Resources Board  
Clerk's Office  
1001 I Street  
Sacramento, CA 95814

(Submitted electronically to:

[https://www.arb.ca.gov/lispub/comm/bcsubform.php?listname=oqvatberth2019&comm\\_period=1](https://www.arb.ca.gov/lispub/comm/bcsubform.php?listname=oqvatberth2019&comm_period=1))

Dear Mr. Corey:

**SUBJECT: SECOND 15-DAY CHANGES TO THE PROPOSED CONTROL MEASURE FOR OCEAN-GOING VESSELS AT BERTH**

The Port of Long Beach and Port of Los Angeles (Ports) appreciate this opportunity to provide comments on the California Air Resources Board (CARB) Second 15-Day Changes Package for the Proposed Control Measure for Ocean-Going Vessels at Berth released on July 10, 2020. This latest iteration of rulemaking reflects some of our ongoing discussions with CARB staff on the proposed rulemaking for over the past two years, and we very much appreciate your staff's willingness to engage on these issues.

We are facing an unprecedented public health crisis, which has and will continue to have significant adverse economic impacts on the maritime industry and the world at large. The Ports have experienced a 12.52% decline in cargo throughput over the first half of 2020, compounding the challenges we have experienced due to the global trade wars and the ongoing loss of market share. We will continue to closely monitor and evaluate economic developments, but anticipate these impacts will continue to reverberate throughout the industry for many years to come.

In light of this, we recommend that your Rule include a mechanism that allows for a timely reassessment of the regulation with greater flexibility in the event that economic conditions warrant it. For example, as regulatory requirements go into effect, the Ports suggest that "check-ins" or other types of assessment steps can occur that will allow the various stakeholders to be a part of the implementation process, and assure that the steps envisioned can be implemented.

After reviewing the Second 15-Day Changes for the At Berth Regulation, the Ports offer the following comments.

Port of LONG BEACH  
THE GREEN PORT

Port of Long Beach | Environmental Planning  
415 W. Ocean Blvd | Long Beach, CA 90802  
562.283.7100

THE PORT  
OF LOS ANGELES

Port of Los Angeles | Environmental Management  
425 S. Palos Verdes Street | San Pedro, CA 90731  
310.732.3675

*The San Pedro Bay Ports Clean Air Action Plan was developed with the participation and cooperation of the staff of the US Environmental Protection Agency, California Air Resources Board and the South Coast Air Quality Management District.*

- While the 2025 implementation timeline for Roll-On/Roll-Off ships (RoRos) is better than the previous proposal for 2024, as articulated in the Ports previous joint letter from April 29, 2020, the Ports remain concerned that this industry will not be able to develop, commercialize, and widely deploy the required technology within this timeframe. Respectfully, the Ports still support the previously requested a timeline for RoRo implementation of 2027.
- Development of tanker vessel emission capture and control technology is nascent. We believe the 2025 timeline is infeasible, and a deadline of 2029 will be necessary. The hurdles to overcome the safety challenges associated with the tanker vessels are significant, and a hazard assessment must be conducted. We understand you plan to release a \$10 million solicitation to fund development, testing, and certification of this technology. According to your webinar hosted on July 15, you anticipate the selected project demonstration to conclude by 2025. This does not leave any time for production, purchase, and implementation of the remaining eight systems required in the San Pedro Bay according to your agency's Berth Analysis.
- The steep cost of this regulation - \$2.23 billion - will have a substantial impact on the industry. The combined impact of the global trade wars, COVID-19, and implementation of more stringent regulatory requirements will likely result in additional cargo diversion, and consequently, excess emissions at non-California ports. Declining harbor revenues, lack of available cap-and-trade revenues, and competing funding needs for reduction of emissions from other sources have decreased the availability resources for implementation of this measure. The Ports ask that you appropriate significant funding during this time to make this rulemaking successful while ensuring our California ports remain competitive. Previously, the Ports requested at least \$200 million to support technology advancement and deployment. We reiterate this request, and ask that these dollars be appropriated to both RoRos and tankers statewide.

10-1

Lastly, we would like to highlight a new issue regarding the Interim Evaluation language:

- The Interim Evaluation, to be published by December 2022, is going to be critical in defining progress the industry will have made towards achieving the requirements of the new At Berth Regulation. A significant amount of data will need to come from ports, terminal operators, vessel operators, and any grant funded demonstration projects. It is unclear in the new regulatory language whether or not industry data will be accepted. We request that the development of the recommendations from this Interim Evaluation be based upon data provided by those organizations impacted directly, and the process for including data is transparent.

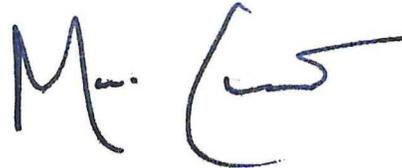

We thank you and your staff for your recommendations to their Board on June 25, 2020, and we thank your Board for recognizing the uncertain and unprecedented challenges the port industry faces today. While we agree we need the emission reductions from vessels at berth in order to move the needle on public health and clean air for our communities, we do continue to diverge on the level of effort it will take, the cost, and the time needed for successful implementation of this measure. The Ports are committed to working closely with your staff on developing the Proposed Control Measure for Ocean-Going Vessels at Berth and look forward to ongoing dialogue on these issues.

Please feel free to reach out to Morgan Caswell, Port of Long Beach Manager of Air Quality Practices at (562) 283-7138 or via email at [morgan.caswell@polb.com](mailto:morgan.caswell@polb.com) or Teresa Pisano, Port of Los Angeles Marine Environmental Supervisor at (310) 732-3057 or via email at [tpisano@portla.org](mailto:tpisano@portla.org), with any specific questions.

Sincerely,

EUGENE SEROKA

Subject: Comments on Second Notice of Public Availability of Modified Text and Availability of Additional Documents and Information

Dear Ms. Csondes:

The Port of Oakland (Port) appreciates this opportunity to comment on the Proposed Control Measure for Ocean-Going Vessels At Berth (Proposed Control Measure). The Port notes that this is its seventh (7<sup>th</sup>) comment letter on the topic. The Port has not received written responses to any of its previous comments and has concerns about this rulemaking process. Given that several of the Port's outstanding questions are substantive, the Air Resources Board members are being asked to vote on the regulation before our technical and feasibility concerns have been addressed and answered. As a result, this process risks becoming a "check the box" exercise rather than a meaningful exchange leading to an improved regulation that will continue to meet our mutual objectives of reducing emissions from seaport sources.

Briefly, the Port must reiterate the following comments:

- The Port of Oakland has no feasible Alternative Compliance Method
- The foundational analysis for the Proposed Control Measure is flawed
- The complex TIE/VIE regime is ripe for conflict
- The current at-berth regulation is successful and should be maintained for containerships

Before offering details for the items above, the Port would like to acknowledge several recent changes that have moved the Proposed Control Measure in a positive direction. These include allowing containerships to stay under the 2007 At-Berth Regulation until 2023, extending the Innovative Concepts timeframe to five years, and providing a process to request additional

TIEs/VIEs to accommodate anticipated growth in vessel calls. The Port appreciates these changes and notes that some of them are partially responsive to concerns the Port has raised.

### **The Port has No Feasible Alternative Compliance Method**

According to CARB's own analysis, the Port of Oakland has no feasible alternative compliance method at three out of four of its terminals (representing 83% of the Port's call volume). This means that carriers that might choose to rely on a barge-mounted bonnet system for compliance at the San Pedro Bay Ports will not have a compliance option in Oakland, where the only feasible compliance method is shore power. This puts the Port of Oakland at a substantial disadvantage, especially as compared to alternative gateways outside California in Tacoma, Seattle, Vancouver, and Prince Rupert, for example. Diverting cargo to distant seaports can lead to increased emissions, undermining the purpose of the regulation.

We still need to understand how ARB staff will address these practical concerns about creating an alternative compliance method that is infeasible for the overwhelming majority of ship operations at the Port of Oakland, given the major negative impacts that could result (decreased Port competitiveness, loss of market share, diverted cargo, increased emissions, etc). This is a matter than needs to be addressed before the Board considers the adoption of the Proposed Control Measure.

### **The Foundational Analysis for the Proposed Control Measure is Flawed**

The analysis that serves as the foundation for this rule both underestimates the efficacy of the current At-Berth Regulation *and* overstates the benefit of the Proposed Control Measure. The discrepancies listed below need to be addressed prior to approval of the Proposed Control Measure.

CARB staff appear to be unwilling to modify certain data that underpin the benefits of this rule if they are in conflict with a desired outcome. CARB staff have acknowledged that there are significant discrepancies between data assumptions and actual observed practices that could impact the analysis, but there has been little-to-no follow through to correct these data gaps. We are concerned that a refusal to incorporate Oakland's 2016 baseline data or to officially update the expected cargo growth rate for Oakland or to remove the incorrect 80% cap on the benefit of the current regulation, will produce a distorted result that justifies a changed rule for containerships based on faulty assumptions.

- a. The emissions benefit calculation caps the benefit of the current regulation at 80%. This is incorrect because it ignores demonstrated overcompliance due to 1) the provision requiring every vessel capable of plugging in to do so, 2) the long call durations at the San Pedro Bay Ports resulting in ~96% emission reductions, 3) the fact that some infrequent callers are plugging in even though they are not required to do so, and 4) the required 90% compliance rate for shore power systems that received grant funding.

The artificial 80% benefit cap is not even internally consistent within CARB's own documents. According to page 22 of the 2007 regulation (text copied in below),

11-1

CARB assumes 90% reductions for any ship that plugs in. Why does the analysis cap the benefit of the 2007 regulation at 80%?

11-1  
(cont'd)

**(4) Control Factors**

**(A) The emissions from vessels using grid power in lieu of the vessel's auxiliary engines when the vessels are at berth are presumed to be reduced by 90 percent.**

- b. CARB's 2016 baseline data for shore power operations in Oakland are neither reliable nor reflective of actual usage. Comparing summaries by vessel class size to the Port of Oakland's own data (used for billing and subject to audit), the values are off by up to 40% in critical areas. Port staff discussed this problem with CARB staff and showed them the comparison during a phone call on January 15, 2020. CARB staff offered to investigate the issue and spot check some data points to try to understand it better. To date, nothing has happened. Port staff have continued to raise this issue, but it remains unaddressed and unresolved. The baseline data are critical for accurately evaluating any future benefits of the Proposed Control Measure, so this needs to be addressed.
- c. As recognized by CARB staff, the assumed growth rate for the Port Oakland is too high and does not comport with any recent or anticipated cargo trends. The inventory assumes an unreasonably aggressive 5% compounded annual growth rate for the Port of Oakland. CARB staff agreed it should be lowered to 2.2% to be in line with the recently finalized Bay Area Seaport Forecast (by Tioga Group for the San Francisco Bay Conservation and Development Commission, dated May 22, 2020). CARB staff said they would address this in summer 2020, but that does not seem to have happened and does not appear to be scheduled before the Board votes on this item. This is also a critical factor that, if left unaddressed, would artificially inflate any future emissions from OGV operations in Oakland and overstate the benefit of the Proposed Control Measure.

The Port suggests that CARB staff resolve all three of these issues *before* a vote is taken on the Proposed Control Measure. These adjustments may change the outcome of the cost-benefit analysis, and hence the need for containerships to be placed under the Proposed Control Measure.

The Port has kept meticulous shore power records and would be happy to share information and provide reliable data sets to CARB.

**The complex TIE/VIE regime is ripe for conflict**

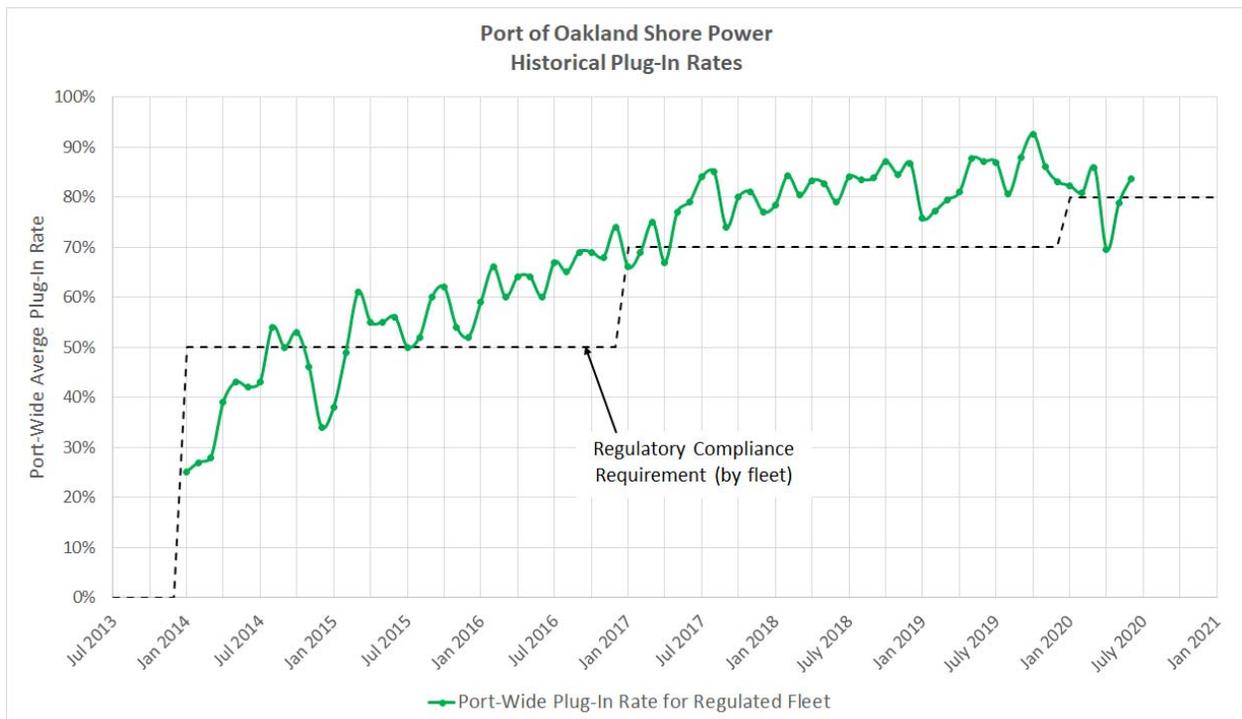

The Port is concerned about the Proposed Control Measure's potential to create conflict and disputes rather than collaboration among terminal operators, vessel operators and the local seaport. The Port has expressed this concern to CARB in previous correspondence. Given the Port's extensive experience working with our marine terminal operators and shipping lines on compliance with the At-Berth regulation, it is curious that CARB staff would not be receptive to

the Port’s know-how and operational concerns. Specifically, the Port is very concerned about the complex regime of TIEs and VIEs and the interplay with fleets that choose the Innovative Concepts route. For example, a terminal operator that has expended its TIE budget for the year would be incentivized to give more favorable berth assignments to ships on the TIE/VIE regime over ships on the fleet averaging regime. There are many foreseeable scenarios where a missed plug-in is not clearly the fault of the vessel owner or the terminal operator. How will CARB staff navigate these grey areas?

The Port recommends that CARB maintain the framework of the existing At-Berth Regulation for containerships.

### The Current At-Berth Regulation is Successful and Should be Maintained for Containerships

The current At-Berth Regulation has proven to be successful for containerships. The graph below shows the Port of Oakland’s shore power plug-in rate since 2014 for the regulated fleet.<sup>1</sup> This graph underscores the effectiveness of the current At-Berth Regulation.

Clearly, ships coming to the Port of Oakland consistently over-perform in terms of the required regulatory compliance plug-in rates. The temporary decline in plug-ins in Spring 2020 was due to the Port’s inability to perform vessel commissioning due to COVID-19, however the Port fully expects the plug-in percentages to rise since the Port resumed commissioning in May 2020.

CARB staff have given presentations indicating that the Innovative Concepts provision will allow for regulated vessel fleets to use fleet averaging methods to comply with the Proposed

<sup>1</sup> Steamships and infrequent callers not subject to the current regulation are not included in this graph.

Control Measure. However, that is not explicitly stated in the regulation language. The provision for fleet averaging to be used as an Innovative Concept must be included in the language of the regulation to give carriers certainty. Otherwise, CARB staff could change their mind about its acceptability. Further, the Innovative Concept rule has one single application deadline, December 1, 2021. Does that mean that fleets entering the California market in 2022 are not allowed to use fleet averaging? What about fleets that start using the TIE/VIE regime but then wish to switch to fleet averaging, would that be allowed? CARB needs to include certainty about fleet averaging, and a mechanism to allow it after December 1, 2021.

The Innovative Concept provision is a step in the right direction. But for simplicity's sake, if the current regime is already acceptable as an Innovative Concept, why not let the current regime stay in place? Why force the carriers to re-apply every five years for a proven method that is already working? The application process with public review is burdensome, the five-year limit injects uncertainty, and the one-time application deadline is an unfair barrier for future fleets.

The Port of Oakland recommends that CARB maintain the framework of the existing At-Berth Regulation for containerships. California's container shipping industry has successfully coalesced around this existing regulation, is complying well with the regulation and is achieving the desired compliance levels and air quality reduction outcomes.

## **Closing**

Lastly, the Port of Oakland reiterates that today's July 27, 2020, letter is the Port's seventh (7<sup>th</sup>) letter to CARB providing comments and expressing concerns about the Proposed Control Measure. The Port has expended considerable time and personnel resources combing through the proposed regulation and raising substantive concerns about many different aspects of the rule as well as the data upon which it is based.

To date, CARB staff have not provided written responses to the questions and comments posed in the Port of Oakland's first six letters. The Port has attached the previous six letters to today's letter, and specifically requests detailed responses to each of the questions raised in all the Port's letters. The Port believes that CARB's expressed intention to provide meaningful stakeholder engagement requires timely, substantive written responses to questions and comments made by the Port of Oakland and other stakeholders.

The Port of Oakland is fully engaged and committed to reducing at-berth emissions and increasing shore power usage. The Port firmly believes that California's container terminals can achieve the desired outcomes of the Proposed Control Measure without getting mired in an unnecessarily complicated new regulation that is analytically flawed and presents the potential for conflict among seaports, terminal operators and vessel owners and operators.

The Port of Oakland looks forward to working with CARB on the emissions inventory and associated analyses. Please contact Ms. Tracy Fidell, P.E., Port Associate Environmental Planner/Scientist at [tfidell@portoakland.com](mailto:tfidell@portoakland.com) with any follow-up questions and responses.

Sincerely,

Richard Sinkoff  
Director of Environmental Programs and Planning

Subject: Comments for CARB Board Meeting on June 25, 2020, Agenda Item 20-6-4: Public Meeting to Hear an Informational Update on Control Measure for Ocean-Going Vessels At Berth

Dear Ms. Csondes:

The Port of Oakland (Port) appreciates the opportunity to comment on the Proposed Control Measure for Ocean-Going Vessels At Berth (Proposed Control Measure). The Port understands that the California Air Resources Board (CARB) is planning for the Proposed Control Measure to replace the current Airborne Toxic Control Measure for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (current At-Berth Regulation), with the goal of having the new rule in place in 2021.

Briefly, the Port has the following comments:

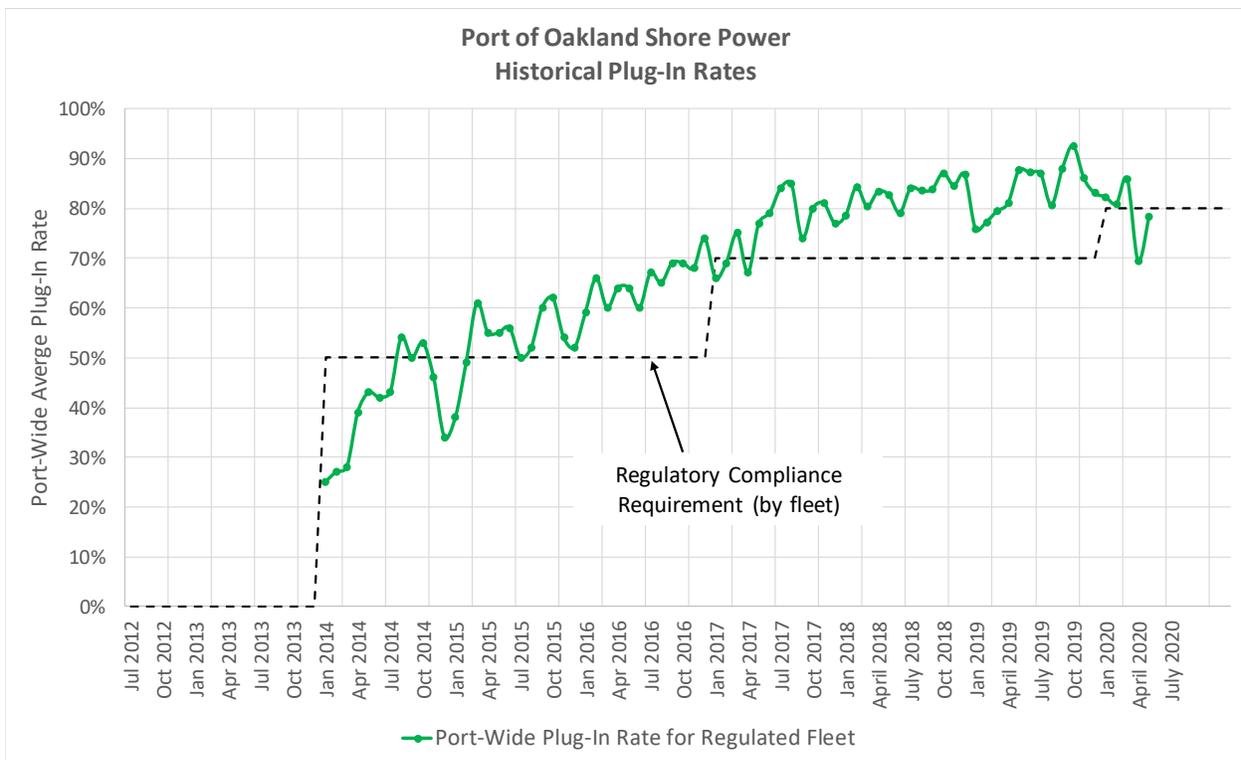

- The current at-berth regulation is successful and should be maintained for containerships
- The Port of Oakland has no feasible Alternative Compliance Method
- The foundational analysis for the Proposed Control Measure is flawed
- TIEs vs. VIEs create a potential for conflict

Before giving detailed comments on the regulation, the Port questions whether CARB's timeline for implementing the Proposed Control Measure is still appropriate and feasible. As CARB is aware, California and U.S. seaports and goods movement industry stakeholders are responding to an unprecedented global economic and public health crisis. The maritime industry, which includes California and U.S. seaports, is included within the transportation critical infrastructure sector defined by the Department of Homeland Security. The maritime industry, operating under extraordinarily challenging public health, safety and financial conditions due to the COVID-19

pandemic, has swiftly reprioritized and reallocated scarce personnel and financial resources to ensure the continuity of essential supply chain services to the public, communities, businesses and local, state and federal government agencies around the United States. It seems problematic and inattentive to these challenges for CARB to require California seaports, terminal operators, and shipping companies to divert their limited resources and attention to this rulemaking process and subsequent requirements when lives and jobs are at risk. We respectfully request that CARB place the rulemaking process on “pause” to allow the maritime industry to focus its resources and attention on the performance of its critical supply chain functions and services in response to the COVID-19 pandemic. CARB could use this time to refine the analysis that serves as the foundation for the Proposed Control Measure

**The Current At-Berth Regulation is Successful and Should be Maintained for Containerships**

The current At-Berth Regulation has proven to be successful for containerships. The graph below shows the Port of Oakland’s shore power plug-in rate since 2014 for the regulated fleet.<sup>1</sup> This graph underscores the effectiveness of the current At-Berth Regulation.

It is clear that ships coming to the Port of Oakland consistently over-perform in terms of the required regulatory compliance plug-in rates. The decline in plug-ins in April 2020 was due to

<sup>1</sup> Steamships and infrequent callers not subject to the current regulation are not included in this graph.

the Port's inability to perform vessel commissioning due to COVID-19, however the Port fully expects the plug-in percentages to rise since that the Port resumed commissioning in May 2020.

The Innovative Concepts provision provides a pathway "for regulated vessel fleets to continue using fleet averaging methods to comply with the Proposed Regulation." If the current regime is already acceptable as an Innovative Concept, why not let the current regime stay in place? Why force the carriers to re-apply every three years for a proven method that is already working? The application process with public review is burdensome and the three-year limit injects uncertainty.

The Port of Oakland recommends that CARB maintain the framework of the existing At-Berth Regulation for containerships. California's container shipping industry has successfully coalesced around this existing regulation, is complying well with the regulation and is achieving the desired compliance levels and air quality reduction outcomes.

### **The Port has No Feasible Alternative Compliance Method**

According to CARB's own analysis, the Port of Oakland has no feasible alternative compliance method at three out of four of its terminals (representing 83% of the Port's call volume). This means that carriers relying on a barge-mounted bonnet system for compliance at the San Pedro Bay Ports will not be able to call Oakland, where the only feasible compliance method is shore power. This puts the Port of Oakland at a substantial competitive and operational disadvantage, especially as compared to its competitor ports outside California in Tacoma, Seattle, Vancouver, and Prince Rupert. Diverting cargo to distant seaports leads to increased emissions, undermining the purpose of the regulation.

### **The Foundational Analysis for the Proposed Control Measure is Flawed**

The analysis that serves as the foundation for this rule both underestimates the efficacy of the current At-Berth Regulation *and* overstates the benefit of the Proposed Control Measure. The discrepancies listed below need to be addressed.

- a. The emissions benefit calculation caps the benefit of the current regulation at 80%. This is incorrect because it ignores demonstrated overcompliance due to 1) the provision requiring every vessel capable of plugging in to do so, 2) the long call durations at the San Pedro Bay Ports resulting in ~96% emission reductions, and 3) the fact that some infrequent callers are plugging in even though they are not required to do so.
- b. CARB's 2016 baseline data do not seem reliable. Comparing summaries by vessel class size to the Port of Oakland's own data (used for billing and subject to audit), the values are off by up to 40% in critical areas.
- c. As recognized by CARB staff, the assumed growth rate for the Port Oakland is too high. The inventory assumes a 5% compounded annual growth rate (CAGR) for the Port of Oakland, which CARB staff have agreed should be lowered to 2.2% to be in line with the recently finalized Bay Area Seaport Forecast (by Tioga Group for the San Francisco Bay Conservation and Development Commission, dated May 22,

2020). Considering the current COVID-19 crisis and the related documented decline in cargo throughput at California seaports, the 5% CAGR is highly speculative and unreliable at best and should not serve as the analytical basis to estimate projected emissions reductions and cost-effectiveness of the Proposed Control Measure.

CARB inventory staff have acknowledged these issues in a many phone calls and emails to Port of Oakland staff. CARB staff members have said that they will address these issues in Summer 2020, which is too late to make the required adjustments or revisions under the proposed rulemaking and adoption schedule.

The Port suggests that CARB take the time available now during the COVID-19 crisis to reassess its baseline data, compliance assumptions, and inventory calculations. The Port has kept meticulous shore power records and would be happy to share information and provide reliable data sets to CARB.

### **TIEs vs. VIEs and the Potential for Conflict**

The Port is concerned about the Proposed Control Measure's potential to create conflict and failure rather than collaboration among terminal operators, vessel operators and a local seaport. The Port of Oakland has expressed this concern in previous correspondence (i.e., letters submitted in the public record) to CARB. Specifically, the Port is very concerned that the proposed complex regime of TIEs and VIEs will lead to disputes, rather than collaboration, among terminal operators, vessel operators, and a local seaport. It is doubtful whether CARB enforcement staff possesses the necessary dispute resolution expertise to referee the foreseeable conflicts. Again, the Port of Oakland recommends that CARB maintain the framework of the existing At-Berth Regulation in place for containerships.

### **Closing**

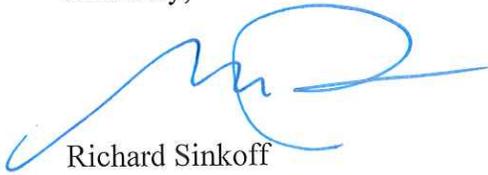

Lastly, the Port of Oakland notes that today's June 25, 2020, letter is the Port's sixth (6<sup>th</sup>) letter to CARB providing comments and expressing concerns regarding the Proposed Control Measure. (See attachments to this letter, below.) The Port has expended considerable time and personnel resources combing through the proposed regulation and raising substantive concerns and questions about many different details of the proposed regulation and the data upon which it is based.

To date, CARB staff have not provided written responses to the questions and comments posed in the Port of Oakland's first five letters. The Port has attached the previous five letters to today's letter, and specifically requests detailed responses to each of the questions raised in all the Port's letters. The Port believes that CARB's expressed intention to provide meaningful stakeholder engagement requires that CARB timely and diligently provide substantive written responses to questions raised and comments made by the Port of Oakland and other stakeholders.

The Port of Oakland is fully engaged and committed to reducing at-berth emissions and increasing shore power usage. The Port firmly believes that California seaports can achieve the desired outcomes of the existing shore power rule without getting mired in an unnecessarily complicated new regulation that is analytically flawed and presents the potential for conflict among seaports, terminal operators and vessel owners and operators.

The Port of Oakland looks forward to working with CARB on the emissions inventory and associated analyses. Please contact Ms. Tracy Fidell, P.E., Port Associate Environmental Planner/Scientist at tfidell@portoakland.com with any follow-up questions and responses.

Sincerely,

Richard Sinkoff  
Director of Environmental Programs and Planning

Subject: Comments on March 26, 2020 Notice of Availability of Modified Text for Proposed Control Measure for Ocean-Going Vessels at Berth (15-day changes)

Dear Ms. Csondes:

The Port of Oakland (Port) appreciates the opportunity to comment on the rulemaking materials posted March 26, 2020, for the Proposed Control Measure for Ocean-Going Vessels At Berth (Proposed Control Measure). The Port understands that the California Air Resources Board (CARB) is planning for the Proposed Control Measure to replace the current Airborne Toxic Control Measure for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (current At-Berth Regulation), with the goal of having the new rule in place in 2021.

The Port of Oakland has a very successful shore power program, underscoring the effectiveness of the current At-Berth Regulation. In 2018, 83% of regulated vessel calls<sup>1</sup> at the Port of Oakland drew shore power, surpassing the regulatory requirement of 70% compliance. The plug-in rates at the Port of Oakland are increasing as more carriers retrofit their vessels for shore power. In 2019, the success rate for the regulated fleet was 84% and year to date for 2020, the rate is tracking at 83%. Once safety exemptions are taken into consideration, compliance is much higher, surpassing 90% at some berths.

Before listing comments on the regulation, the Port questions whether CARB's timeline for implementing the Proposed Control Measure is still appropriate and feasible. As CARB is aware, California and U.S. seaports and goods movement industry stakeholders are responding to an unprecedented global economic and public health crisis. The maritime industry, which

---

<sup>1</sup> Steamships and infrequent callers (<25 calls/year) are exempt from the current regulation.

includes California and U.S. seaports, is included within the transportation critical infrastructure sector defined by the Department of Homeland Security. The maritime industry, operating under extraordinarily challenging public health, safety and financial conditions due to the COVID-19 pandemic, has swiftly reprioritized and reallocated scarce personnel and financial resources to ensure the continuity of essential supply chain services to the public, communities, businesses and local, state and federal government agencies around the United States. It seems problematic and inattentive to these challenges for CARB to require California seaports, terminal operators, and shipping companies to divert their limited resources and attention to this rulemaking process when lives and jobs are at risk, especially since many of the proposed measures are not due to take effect for several years. We respectfully request that CARB place the rulemaking process on “pause” to allow the maritime industry to focus its resources and attention on the performance of its critical supply chain functions and services in response to the COVID-19 pandemic.

### **Specific Comments and Questions on the Proposed Control Measure**

1. One of the Port of Oakland’s main concerns about the Proposed Control Measure is its potential to create conflict and failure rather than collaboration among terminal operators, vessel operators and a local seaport. The Port of Oakland has expressed this concern in previous correspondence to CARB (see attachments to this letter, below). Specifically, the proposed complex regime of TIEs and VIEs has the potential to lead to disputes, rather than collaboration, among terminal operators, vessel operators, and a local seaport. Similarly, the proposed requirement for each port to prepare a “Port plan” and agree upon a “division of responsibilities” between terminal operators and the local seaport adds another potential arena of conflict for each port and its terminal tenants. It is doubtful whether CARB enforcement staff possess the necessary dispute resolution expertise to referee the foreseeable conflicts. The Port of Oakland recommends that CARB maintain the framework of the existing At-Berth Regulation in place for containerships. California’s container shipping industry has successfully coalesced around this existing regulation and has demonstrated consistent overcompliance with the rule.
2. According to the 15-day changes, the Innovative Concepts provision provides a pathway “for regulated vessel fleets to continue using fleet averaging methods to comply with the Proposed Regulation.” If the current regime is already acceptable as an Innovative Concept, why not let the current regime stay in place? Why force the carriers to re-apply every three years for a proven method that is already working? The Port suggests that CARB allow current fleet averaging methods to stay in place for all carriers who desire it without the need to constantly re-apply every three years. The shipping industry thrives on certainty.
3. According to CARB’s own analysis, the Port of Oakland has no feasible alternative compliance method at three out of four of its terminals (representing 83% of the Port’s call volume). This means that carriers relying on a barge-mounted bonnet system for compliance at the San Pedro Bay Ports (SPBP) will not be able to call Oakland, where the only feasible compliance method is shore power. This puts the Port of Oakland at a real disadvantage, especially as compared to its competitor ports in Tacoma, Seattle, Vancouver, and Prince Rupert. Diverting cargo to distant seaports only serves to increase emissions, undermining the purpose of the regulation.

4. The inventory that serves as the foundation for this rule is flawed. It underestimates the efficacy of the current regulation and overstates the benefit of the Proposed Control Measure. The discrepancies listed below invalidate the conclusions of CARB's analysis.
  - a. CARB's 2016 baseline data do not seem reliable. Comparing summaries by vessel class size to the Port of Oakland's own data (used for billing and subject to audit), the values are off by up to 40% in critical areas.
  - b. The inventory calculation caps the benefit of the current regulation at 80%, which disregards current overcompliance primarily due to 1) the provision requiring every vessel capable of plugging in to do so, 2) the long call durations at the SPBP resulting in ~96% emission reductions, and 3) the fact that some infrequent callers are in fact plugging in even though they are not required to do so.
  - c. As recognized by CARB staff, the assumed growth rate for the Port Oakland is too high. The inventory assumes a 5% compounded annual growth rate (CAGR) for the Port of Oakland, which CARB staff have agreed should be lowered to 2.2%. Considering the current COVID-19 crisis and the related documented decline in cargo throughput at California seaports, it is evident that the 5% CAGR is speculative at best and should not serve as the analytical basis to estimate projected emissions reductions and cost-effectiveness of the Proposed Control Measure.

CARB inventory staff have acknowledged these issues in a variety of phone calls and emails to Port of Oakland staff. CARB staff members have said that they will address these issues in Summer 2020, which is obviously too late to make the required adjustments or revisions under the proposed rulemaking and adoption schedule.

The Port suggests that CARB take the time available now during the COVID-19 crisis to reassess its baseline data, compliance assumptions, and inventory calculations. The Port has kept meticulous shore power records and would be happy to share information and provide reliable data sets to CARB.

5. Lastly, the Port of Oakland notes that today's May 1, 2020, letter is the Port's fifth letter to CARB providing comments and expressing concerns regarding the Proposed Control Measure. (See attachments to this letter, below.) The Port has expended considerable time and personnel resources combing through the proposed regulation and raising substantive concerns and questions about many different details of the proposed regulation and the data upon which it is based. To date, CARB staff have not provided written responses to the questions and comments posed in the Port of Oakland's first four letters. The Port has attached the previous four letters to today's letter, and specifically requests detailed responses to each of the questions raised in all the Port's letters. The Port believes that CARB's intention to provide meaningful stakeholder engagement requires that CARB timely and diligently provide substantive written responses to questions raised and comments made by the Port of Oakland and other stakeholders.

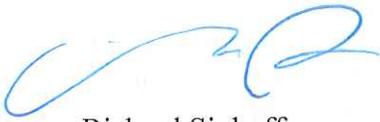

## **Closing**

The Port of Oakland appreciate the opportunity to review the 15-day changes to the Proposed Control Measure. As the Port of Oakland's maritime air quality policies and plans – Maritime

Air Quality Improvement Plan (2009) and Seaport Air Quality 2020 and Beyond Plan (2019) – emissions inventories, and shore power records and data show, among other policies and documents, the Port of Oakland is fully engaged and committed to reducing at-berth emissions and increasing shore-power usage. However, the Port believes that California seaports can achieve the desired outcomes of the existing shore power rule without getting mired in an unnecessarily complicated new regulation that is analytically flawed and presents the potential for conflict among seaports, terminal operators and vessel owners and operators.

The Port of Oakland looks forward to working with CARB on the emissions inventory and associated analyses. Please contact Tracy Fidell, P.E., Port Associate Environmental Planner/Scientist at [tfidell@portoakland.com](mailto:tfidell@portoakland.com) with any follow-up questions and responses.

Sincerely,

Richard Sinkoff  
Director of Environmental Programs and Planning

Subject: Comments on May 10, 2019, Draft Proposed Control Measure for Ocean-Going Vessels At Berth and Supporting Documents

Dear Ms. Csondes:

The Port of Oakland (“Port”) appreciates the opportunity to comment on the rulemaking materials posted May 10, 2019, for the Proposed Control Measure for Ocean-Going Vessels At Berth (“Proposed Control Measure”). The Port understands that the California Air Resources Board (“CARB”) is planning for the Proposed Control Measure to replace the current Airborne Toxic Control Measure (“ATCM”) for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (the “At-Berth Regulation”), with the goal of taking the Proposed Control Measure to the CARB Governing Board in December 2019. On May 10, 2019, CARB posted the revised text of the Proposed Control Measure, and provided, as supporting documents, the presentation from the May 14 and May 16, 2019 public workshops, Cost Inputs and Assumptions in PDF format, and Cost Estimates in Excel format.

The Port supports CARB’s ongoing efforts to reduce emissions from ocean-going vessels (“OGVs”) at berth and is working diligently to maximize the number of vessel visits using shore power. Port staff work collaboratively with shipping lines to provide education and resources about the shore power program. Port staff also track shore power usage in real time, collecting detailed information from marine terminal operators. The Port posts shore power usage statistics, reasons for equipped vessels not plugging in, and cost information on our shore power website: <https://www.oaklandseaport.com/development-programs/shore-power/>. In 2018, 75% of all calls to the Port drew shore power.

Public comments on the Proposed Control Measure are due to CARB June 10, 2019. Port staff understand CARB will then finalize the regulatory language and prepare an Initial Statement of

Reasons (“ISOR”) to release on October 18, 2019, with public comment on the ISOR closing on December 2, 2019. The CARB Governing Board is scheduled to hear the Proposed Control Measure on December 5, 2019. Do CARB staff intend to respond to public comment on the ISOR? Three days does not leave time for meaningful CARB response to public comment or public review of subsequent changes to the Proposed Control Measure. Port staff suggest a minimum of 14 days for CARB staff to review and respond to public comment, and for the public to review any changes, before the Proposed Control Measure can be heard.

The Proposed Control Measure includes the concept of an Incident Exemption, which is new since CARB published its draft Proposed Control Measure in August 2018. Vessel fleets would be granted Vessel Incident Exemptions (VIEs) and terminals would be granted Terminal Incident Exemptions (TIEs). Starting in 2021 for container ships and terminals, VIEs and TIEs would be granted at levels of 5% of the previous calendar year’s calls. CARB stated at the May 14, 2019, public workshop that the expected plug-in level for the container fleet is 90% in 2021.

Port staff submit the following comments and questions, divided into the topic areas of the draft regulatory text of the Proposed Control Measure, the presentation from the May 14, 2019 and May 16, 2019 public workshops, and the Cost Inputs and Assumptions in PDF format.

### **Comments and Questions on the Draft Regulatory Text of the Proposed Control Measure**

1. Port staff request clarification on the definition of “necessary infrastructure...that will enable a terminal to comply with this Control Measure” in Section 93130.10(b) of the Proposed Control Measure and what, in this context, “subject to verification by [CARB] enforcement staff” means. From Table XI Berth and Terminal Counts, Anticipated Infrastructure Needs, and Unique Vessels of the CARB Cost Inputs and Assumptions in PDF format, it appears that CARB believes that three new shore power vaults “would be installed in response to the Draft Regulation [Proposed Control Measure]...” at the Port. Accordingly Port staff request documentation supporting CARB staff’s berth-by-berth infrastructure analysis and determination that three new shore power vaults would be required at the Port in response to the Proposed Control Measure.
2. Regarding the Terminal and Port Plans required for Container terminals in Section 93130.11 of the Proposed Control Measure, the deadline of June 1, 2020 does not allow for sufficient time after the anticipated adoption of the Proposed Control Measure for ports and terminals to submit plans. Port staff object to the text in Section 93130.11(a) that “[a]s an alternative, Ports may submit plans for their terminal operators.” Ports should not be expected to submit plans for terminal operators. In addition, the statement in Section 93130.10(b) of the Proposed Control Measure that “Ports should use terminal plans as [the] basis for developing port plans” seems to indicate that the deadline for Port Plans should be adjusted to come after the deadline for Terminal Plans.
3. The definition of “Fleet” in Section 93130.2(b)(22) of the Proposed Control Measure does not explain how fleets will be established. What will CARB require at the beginning

of each compliance year to establish fleets? Will this be part of the online Freight Regulations Reporting System (“FRRS”) mentioned in the presentation from the May 14, 2019 and May 16, 2019 public workshops?

Port staff request an initial accommodation for new fleets entering the California market. New entrants should be given an opportunity to estimate the coming year’s ship calls and estimate the number of VIEs to be awarded for the coming year.

The definition of Fleet and the requirements for VIEs also need to be responsive to changes in the shipping industry, for example when businesses merge or alliances change. Likewise, CARB should clarify what provisions will accommodate changes in the terminal industry, such as new terminals or changes in ownership, in the allocation of TIEs.

4. Port staff have two comments regarding vessel commissioning. Port staff request that vessel commissioning events that do not successfully connect to shore power as discussed in Section 93130.7(f)(2) of the Proposed Control Measure be considered eligible for exceptions under the regulation. The commissioning attempt shows that the goal was to reduce emissions through shore power and as such an Exception should be available to operators in this situation. Port staff conduct each vessel commissioning (with the exception of those at the Matson Terminal) to ensure the safety of the vessel, terminal, and workforce. Vessel commissioning is an invaluable safety procedure and should not be penalized under the Proposed Control Measure.

Port staff request that the definition of “Vessel Commissioning” in Section 93130.2(b)(61) of the Proposed Control Measure be expanded to include the case in which the port authority is the commissioning agent, as is the case at the Port of Oakland. Likewise, in Section 93130.7(d)(1) (“If applicable, commission vessel as required by terminal operator”), Section 93130.8(a)(4) (“It is the terminal operator’s responsibility to commission vessels equipped with shore power”), and Section 93130.8(d)(1) (“If applicable, commission vessel for use of shore power”), the commissioning requirement should be determined by the port authority or the terminal operator.

5. The reduction in VIEs and TIEs for Container, Reefer, and Passenger vessels from 5% each to 3% each discussed in Sections 93130.7(g)(1)(A)(ii) and 93130.8(h)(1)(A)(ii) of the Proposed Control Measure serves to increase the usage of the Remediation Fund [Section 93130.12(a)] in and after 2023. Port staff request further information from CARB on when and where the Remediation Fund will be deployed, given that CARB anticipates zero-emissions regulation on trucks, transport refrigeration units, forklifts, and cargo-handling equipment in the time frame of enhanced usage of the Remediation Fund, making those categories ineligible for incentive-funded emissions reductions.

6. The allotted VIEs and TIEs for vessels other than Container, Reefer, and Passenger vessels in Sections 93130.7(g)(1)(A) and 93130.8(h)(1)(A) of the Proposed Control Measure reduce from 5% to 3% after only one year. Port staff note that at the advent of the ATCM, the requirement was 50% of all calls in the first year. An initial expectation of 90% usage does not accommodate the fact that the Proposed Control Measure is the first-of-its-kind requirement for Ro-Ro and Tanker vessels in the world, and the technologies and equipment required do not exist at this time and have not been tested.
7. Regarding the Remediation Fund described in Section 93130.12 of the Proposed Control Measure, what is the procedure and timeline for CARB to approve a public entity to manage the funds generated at the Port?
8. Port staff request clarification from CARB of what constitutes a failure to achieve “full emission reductions” as referenced in Section 93130.12(a)(3) of the Proposed Control Measure, regarding when the Remediation Fund may be used.
9. In response to the suggestion in Section 93130.8(a)(2) of the Proposed Control Measure that a terminal operator should be responsible to interrupt a vessel call to shift the vessel to a berth with shore power if no berth was previously available, Port staff request CARB prepare and share an analysis of harbor craft emissions associated with such a shift at each port. Second to OGV, harbor craft are the second-highest emitting sources of emissions in the Port’s 2017 Emissions Inventory. Given the short duration of the average vessel call to the Port, the suggestion to call additional harbor craft to reduce the remaining hours of an OGV call’s auxiliary emissions could lead to increased overall emissions.
10. Likewise, Port staff question if the suggestion in Section 93130.8(a)(3) of the Proposed Control Measure that a terminal operator should be responsible to provide an alternative CARB-approved emission control strategy if a commissioned shore power vessel is berthed such that it cannot connect to shore power is necessary. CARB’s own analysis in the Cost Inputs and Assumptions in PDF format, Table XI, declares that no barge-based capture and control system is anticipated for the Port.
11. Port staff note that the “power meter readings at the time of shore power connection and disconnection” requested in Section 93130.8(e)(2)(C) of the Proposed Control Measure are typically not available within 7 calendar days of a vessel’s departure, as anticipated by CARB. Power meter readings at the Port are typically available at the close of the calendar month and not sooner.
12. In Section 93130.1 of the Proposed Control Measure, the stated intent of the Proposed Control Measure is “to ensure that operators of ocean-going vessels reduce emissions using a California Air Resources Board (CARB) approved emission control strategy to reduce PM, NOx, and ROG emissions at berth without increasing overall GHG emissions from this Control Measure...” How will CARB monitor GHG emissions after

implementation of the Proposed Control Measure and what is the GHG emissions baseline?

### **Comments and Questions on the presentation from the May 14, 2019 and May 16, 2019 public workshops**

13. On Slide 4 of the presentation for the May 14, 2019 and May 16, 2019, public workshops, CARB staff show OGV at-berth emissions for the entire state. Port staff request to see these emissions totals further tabulated both by port or marine terminal and by vessel type. This is especially important as, per Section 93130.7(g)(2) of the Proposed Control Measure, VIEs are specific to the Fleet-Port pairing they are granted to.
14. On Slides 5 and 29 of the presentation for the May 14, 2019 and May 16, 2019 public workshops, CARB staff show a table of cost effectiveness for this rulemaking. The Port provides specific comments on the cost estimates below. Port staff request to see the total cost estimates and cost effectiveness estimates further tabulated both by port and by vessel type.

### **Comments and Questions on the Cost Inputs and Assumptions in PDF format**

15. In Table V. Auxiliary Engine Effective Power Values, CARB states that it is relying on “the same power values cited in Table 7 of the emission inventory methodology <https://ww3.arb.ca.gov/msei/ordiesel/draft2019ogvinv.pdf>. Values used in cost analysis for container/reefer and tanker vessels are calculated as one kW-average per vessel type, weighted by average vessel kW at each port/terminal and vessel visits to each port/terminal.”

As noted in the Port’s February 15, 2019 letter to CARB regarding the emissions inventory, the emissions inventory relies on the assumption that container vessel effective power is a function of vessel size bin. Will this assumption in the emissions inventory be modified to align with the cost estimate?

16. In Table VI. Duration of Emission Control at Berth, CARB shows that it is estimating statewide emissions reductions based on average duration of emission control at berth per vessel visit. The Port requests an emissions and cost analysis specific to each port or marine terminal and each vessel type. The stated average Container/Reefer duration of emission control at berth of 38.8 hours is about twice the average time for shore power connections at the Port. The difference between Port data and the average shows that the statewide average is not meaningful for the Port, and the conclusions of the averaging analysis may not apply to the Port.
17. Table VIII. Electricity and Fuel Cost Inputs and the associated Cost Estimates in Excel format show that CARB expects 100% of any Low Carbon Fuel Standard (“LCFS”) credits would be reinvested into shore power. It is not guaranteed that the credits would

all be reinvested into shore power. What assumptions did CARB staff make in projecting the LCFS credit value through 2032?

18. Related to the duration of emission control at berth in Table VI, Port staff would like to reiterate that shore power usage at the Port is billed based on hours of use, not kWh drawn. This affects the assumptions in Table VIII. Electricity and Fuel Cost Inputs, as well. While the cost of Pacific Gas & Electric electricity is relevant to the Matson Terminal and the overall discussion of electricity costs, the Port is the utility serving shore power at all but the Matson Terminal.
19. The growth assumptions in Table IX. Growth Factors overestimate actual TEU growth for the Port between 2016 and 2018 and continue to use a 3.9% compound annual TEU growth rate between 2018 and 2032. Port staff request that in addition to this high estimate of TEU growth, CARB prepare an estimate of emissions using a realistic growth estimate. For reference, the Port's CAGR between 2008 and 2018 was 0.4%. Port staff understand that the growth estimates CARB is using for emissions and costs for the Port will align with the vessel fleet projections (such as larger vessels each year) that are being used for the Ports of Long Beach and Los Angeles.
20. Port staff note that the cost of compliance with the existing At-Berth Regulation is high and requires frequent vessel retrofits. In 2018, the Port commissioned or re-commissioned nearly 100 vessels, or about 25% of the ever-commissioned vessel list. The ongoing costs of retrofitting vessels when the line rotation changes, maintaining vessel equipment, and commissioning vessels with the current At-Berth Regulation apply equally to comply with the Proposed Control Measure and should be included in the cost estimates as they are real and necessary costs of compliance with the Proposed Control Measure. The Proposed Control Measure is not additive and incremental to the At-Berth Regulation, but rather a replacement and as such the entire cost to comply with the Proposed Control Measure needs to be factored into the cost effectiveness.

## **Closing**

Port staff appreciate the opportunity to review the Proposed Control Measure and attend the public workshop on May 14, 2019. We look forward to working with CARB on refinements to improve the Proposed Control Measure, emissions inventory, and associated analyses.

Please contact Catherine Mukai, P.E., Port Associate Environmental Planner/Scientist at [cmukai@portoakland.com](mailto:cmukai@portoakland.com) with any follow-up questions.

Sincerely,

Colleen Liang, Port Environmental Supervisor, for

Subject: Comments on *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* for the Proposed Control Measure for Ocean-Going Vessels At Berth and At Anchor

Dear Ms. Csondes:

The Port of Oakland (“Port”) appreciates the opportunity to comment on the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* posted January 15, 2019, for the Proposed Control Measure for Ocean-Going Vessels At Berth and At Anchor (“Proposed Control Measure”). The Port understands that the California Air Resources Board (“CARB”) is planning for the Proposed Control Measure to replace the current Airborne Toxic Control Measure (“ATCM”) for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (the “At-Berth Regulation”), with the goal of taking the Proposed Control Measure to the CARB Governing Board in December 2019. CARB posted the text of the Proposed Control Measure on August 31, 2018. The *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* was prepared in support of the Proposed Control Measure.

The Port supports CARB’s ongoing efforts to reduce emissions from ocean-going vessels (“OGVs”) at berth and is working diligently to maximize the number of vessel visits using shore power. Port staff work collaboratively with shipping lines to provide education and resources about the shore power program. Port staff also track shore power usage in real time, collecting detailed information from marine terminal operators and posting that information on the Port’s website for public information purposes.<sup>1</sup>

---

<sup>1</sup> <https://www.oaklandseaport.com/development-programs/shore-power/>

The *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* document includes emissions from California ports and CARB-defined Marine Terminal Complexes (“MTCs”). The emissions for 2016 are tabulated in Appendix B, while emissions for other years are only represented graphically in figures in the document and in tables published by CARB on November 9, 2018.

Comments on the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* are due to CARB February 15, 2019. CARB will then host a public workshop to discuss the emissions on February 26, 2019. After that, Port staff anticipate the need for a revised emissions inventory for the Proposed Control Measure that responds to public comments. The Port provides wharfinger information to CARB annually as required by grant funding obligations. In addition, Port staff request that CARB staff work with the Port to refine assumptions made in the emissions estimates.

Given the scheduling of the public workshop after the public comment period has closed, this letter includes comments and questions that may best be addressed in the workshop. Thus, the Port is providing a list of comments and questions on the draft emissions inventory and topics for discussion at the February 26 public workshop.

**Comments and Questions on the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results***

1. Why was 2016 selected as the baseline calendar year for the emissions inventory? Does CARB plan to conduct in-depth emissions inventories for 2017 and 2018?
2. Table 4 of the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* shows vessel visit counts to California ports and MTCs in 2016 only. However, current trends are for fewer calls by larger vessels for a given amount of containerized cargo. The discussion on page 25 of the draft clarifies that “vessel practice changes” are not considered, even as the total number of calls is dropping in real time. Since 2013, total annual calls to the Port have been decreasing. Container cargo throughput is thus decoupled from vessel call activity. CARB should expand the vessel growth forecasting for the baseline scenario to include the effects of larger vessels and fewer calls for the same amount of containerized cargo.
3. Table 7 of the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* relies on the assumption that for all ports and MTCs, container vessel effective power will match that of the Ports of Los Angeles and Long Beach in 2016. The effective power does not appear to be a function of vessel size bin, so the level of detail with which the effective power is classified by CARB-defined size bin is not appropriate. In addition, given the variation between data from the Port of Los Angeles and the Port of Long Beach within the same CARB-defined size bin, the data may not be meaningful when averaged by CARB-defined size bin. CARB should use an average effective power for container vessels regardless of size.

4. The growth rates in the Freight Analysis Framework (“FAF”) for ports and MTCs outside of the San Pedro Bay are at odds with current trends. The FAF assumption for container cargo at the Port of Oakland is a 5% year-over-year growth rate between 2016 and 2020. Actual growth rates between 2016 and 2018 have not kept pace, with current Oakland planning documents estimating about half the FAF compound annual growth rate.<sup>2</sup> CARB should adjust the FAF growth forecasting for the baseline scenario to align with actual trends.
5. Page 27 of the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* discusses statistical significance in the context of the emission forecasting. If CARB staff have conducted an uncertainties analysis, it should be included in the methodology and results document.
6. Table 15 of the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* does not treat all ports and vessel types equally when assuming “Projected 2020 and Later Time on Shorepower,” without justifying the differences. For instance, CARB assumes container vessels at the Port of Hueneme spend 80% of their time on shore power after 2020, while CARB assumes at the Ports of Los Angeles and Long Beach container vessels spend only 65% of their time on shore power. Impossibly, CARB-defined size bins 7, 9, and 12 container vessels at the Port of Oakland are assumed to spend 100% of their time at berth on shore power.<sup>3</sup> Port staff request further justification for and synchronization of the assumptions for “Projected 2020 and Later Time on Shorepower.”
7. In the discussion of the “static age distribution model” versus a survival and turnover model, CARB staff do not consider the abnormally high number of OGV keels laid in 2015. How did CARB decide that the spike in keels laid in 2015 was not material to estimating NOx emissions through 2050?
8. CARB should revise its assumption that sulfur content in fuel is 0.1% based on the results of enforcement analyses of in-use fuel sulfur. The sulfur content of in-use fuel as sampled by the CARB enforcement team in calendar years 2017 and 2018 is lower than 0.1% by 30% and almost 50%, respectively, presenting information that actual emissions are lower than those estimated by CARB. (As stated on page 12, information from CARB’s enforcement team is already used to determine reduced emissions from reduced engine activity time.)

---

<sup>2</sup> <https://www.portfoakland.com/community/environmental-stewardship/maritime-air-quality-improvement-plan/>

<sup>3</sup> Vessels arriving at berth need time to tie lines and lower gangways before they can connect shore power and likewise vessels need time to disconnect from shore power when leaving the berth. With these bookends on each vessel call, a vessel cannot be plugged into shore power for 100% of the time at berth.

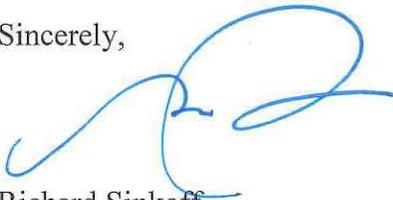

9. CARB should elaborate in the text on the Particulate Matter (“PM”) emission factor for Marine Gas Oil (“MGO”) at 0.1% sulfur. The 2007 Initial Statement of Reasons for At-Berth Regulation rulemaking used a value of 0.25 g/kW-hr for 0.1% S MGO. The *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* uses a PM emission factor of 0.18 g/kW-hr for the same fuel. The root source for OGV auxiliary engine emission factors is stated in both cases as the 2002 Entec study, with no description of why two different values of PM emission factors are used for the same fuel.
10. Please add References to the Table of Contents and to the document (Sources of emission factor information are only included at the end of Appendix A).
11. On page 42, should the last sentence read “it excludes emissions from boilers,” not “it excludes emissions from auxiliary engines”?

### Closing

Port staff look forward to working with CARB to support the updated emissions inventories referred to in the *Draft 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results* after the workshop on February 26.

Subject: Comments on Preliminary Draft Health Risk Assessment (“HRA”) for the Proposed Control Measure for Ocean-Going Vessels At Berth and At Anchor

Dear Ms. Csondes:

The Port of Oakland (“Port”) appreciates the opportunity to comment on the Preliminary Draft HRA posted November 5, 2018, for the Proposed Control Measure for Ocean-Going Vessels At Berth and At Anchor (“Proposed Control Measure”). The Port understands that the California Air Resources Board (“CARB”) is planning for the Proposed Control Measure to replace the current Airborne Toxic Control Measure (“ATCM”) for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (the “At-Berth Regulation”), with the goal of taking the Proposed Control Measure to the CARB Governing Board in December 2019. CARB posted the text of the Proposed Control Measure on August 31, 2018. The November 5, 2018, Preliminary Draft HRA and associated air dispersion modeling files that CARB released December 14, 2018, were prepared in support of the Proposed Control Measure.

The Preliminary Health Analyses document contains two types of assessment, 1) an HRA using air dispersion modeling and impacts estimation guidance from the California Environmental Protection Agency Office of Environmental Health Hazard Assessment (“OEHHA”) and 2) an Incidents per Ton (“IPT”) analysis.

The Port supports CARB’s ongoing efforts to reduce emissions from ocean-going vessels (“OGV”) at berth and is working diligently to maximize the number of vessel visits using shore power. Port staff work collaboratively with shipping lines to provide education and resources about the shore power program. Port staff also track shore power usage in real time, collecting

detailed information from marine terminal operators and posting that information on the Port's web site for public information purposes.<sup>1</sup>

**The key input to the Preliminary Draft HRA is the estimated emissions from vessels at berth, which are not yet final. Emissions estimates need to be final and the Preliminary Draft HRA updated before the Preliminary Draft HRA results can be used.**

CARB conducted two HRAs addressing only the Ports of Long Beach and Los Angeles together and the Richmond Complex. CARB's use of AERMOD and the 2015 OEHHA Risk Assessment Guidelines for HRAs represents current best practices. However, the robustness of the findings is limited by the emissions estimates. Emissions estimates are typically completed before the HRA but in this case are open for public comment and discussion through the end of February 2019, at which point they may be refined.

The air dispersion model AERMOD, which CARB selected for the Preliminary Draft HRA is the preferred model from the US Environmental Protection Agency. Required inputs to AERMOD include meteorological data, emissions information for each pollutant considered, and exhaust parameters for release points. Of these inputs, the estimated emissions are key, since emissions have a direct linear relationship with the estimated ambient concentrations and health impacts from each source.

On November 5, 2018, CARB posted the Preliminary Draft HRA. CARB then posted a hard-coded spreadsheet of "Draft At Berth Emissions Estimates" used in the Preliminary Draft HRA on November 9, 2018, and air dispersion modeling files in mid-December with a public comment period for the Preliminary Draft HRA closing January 31, 2019.

CARB also posted the "Draft: 2018/2019 Update to Inventory for Ocean-Going Vessels: Methodology and Results"—for the emissions that were entered into the Preliminary Draft HRA—on January 16, 2019, with a separate public comment period for the emissions methodology and results closing February 16, 2019.

Without greater understanding of the emissions used as data inputs to the air dispersion model and risk estimation calculations, the utility of the Preliminary Draft HRA is limited. Port staff are reviewing the emissions methodology released on January 16, 2019, and are comparing it with the spreadsheet posted November 9, 2018. Port staff look forward to discussing the emissions with CARB staff at the public workshop CARB scheduled for February 26, 2019. After that, Port staff anticipate the need for a revised HRA for the Proposed Control Measure that relies on emissions that have been reviewed and understood by all parties.

The AERMOD input and output files and risk estimation databases CARB provided on December 14, 2018, appear to carry out the methodology discussed in the Draft Preliminary HRA, but further review is not warranted until emissions are finalized. In addition to the

---

<sup>1</sup> <https://www.oaklandseaport.com/development-programs/shore-power/>

wharfinger information provided by the Port to CARB annually as required by grant funding obligations, Port staff are happy to work with CARB staff to refine assumptions made in the emissions estimates.

**The role of the Preliminary Draft HRA posted November 5, 2018, in rulemaking for the Proposed Control Measure is not clear.**

The Proposed Control Measure is not an ATCM, in fact its stated purpose is to reduce NO<sub>x</sub>, PM, and GHG but not the toxic air contaminant DPM—which is the focus of the Preliminary Draft HRA. The inclusion of an HRA for any of the ports in California is therefore not a fundamental driver of the Proposed Control Measure (leaving the CARB Governing Board direction, Mobile Source Strategy, and Sustainable Freight Action Plan as drivers). Thus, any reductions in risk shown in the Preliminary Draft HRA are purely informational. Indeed, CARB’s elimination of the At-Berth Regulation ATCM by focusing on a Proposed Control Measure for NO<sub>x</sub> and PM but not DPM seems to imply that no further risk reductions are required.

The Preliminary Health Analyses report announces that the risk reductions of the Proposed Control Measure are “significant,” a term defined in the California Environmental Quality Act (“CEQA”) and used in CARB’s Certified Regulatory Program, but not defined in the CARB rulemaking process. While CARB staff present the percentage of reduction in risk of the Proposed Control Measure over the current At-Berth Regulation, the total residual risk should be compared to that of other source categories to prioritize the need for the Proposed Control Measure.

**Health impacts from Criteria Air Pollutants are managed through SIP Planning, which does not require a new Proposed Control Measure for the container fleet.**

PM<sub>2.5</sub> is a criteria air pollutant, not a toxic air contaminant, and the California Ambient Air Quality Standards (“CAAQS”) and National Ambient Air Quality Standards (“NAAQS”) are the appropriate health-protective standards for PM<sub>2.5</sub>. Regional ambient air concentrations of PM<sub>2.5</sub> are managed to levels below the CAAQS and NAAQS through SIP planning. Even so, CARB’s Mobile Source Strategy calls for an evaluation of emissions reductions from currently unregulated fleets, not the already regulated container fleet which calls Oakland. Thus, SIP planning for PM<sub>2.5</sub> attainment does not mandate an amended At-Berth Regulation to reduce statewide emissions through an “every vessel, every visit” control strategy like CARB staff have proposed.

**The Incidents Per Ton (“IPT”) methodology presented for PM<sub>2.5</sub>, a criteria air pollutant, is not a cost effectiveness metric.**

The IPT methodology provides information on health effects assuming ambient PM<sub>2.5</sub> concentration is the sole contributor to adverse health effects, with a direct linear relationship. The IPT methodology is not, however, part of a cost-effectiveness evaluation. CARB released a “Preliminary Cost Information” document in August 2018 as part of this rulemaking effort,

which relies on the same assumptions as the emissions inventory (which, as discussed above, may need refinement). The preliminary costs data evaluated total costs of the Proposed Control Measure, but not cost effectiveness of proposed measures calculated in terms of cost per ton of emissions removed. CARB has also not yet prepared a socio-economic impact analysis of the proposed rule.

**Closing**

Port staff are interested in working with CARB to improve the current ATCM focused on DPM to allow for 100% compliance. We look forward to seeing enhanced supporting documentation for the CARB emissions estimates and a revised HRA and cost effectiveness analysis once the emissions are updated.

Please contact Catherine Mukai, P.E., Port Associate Environmental Planner/Scientist at [cmukai@portoakland.com](mailto:cmukai@portoakland.com) with any follow-up questions.

Sincerely,

A handwritten signature in blue ink, appearing to read "Richard Sinkoff", with a stylized flourish at the end.

Sacramento, CA 95812-2815  
Submitted Via Electronic Comment Log

**Subject: Comments on October 15, 2019, Draft Proposed Control Measure for Ocean-Going Vessels At Berth and Supporting Documents**

Dear Ms. Csondes:

The Port of Oakland (“Port”) appreciates the opportunity to comment on the rulemaking materials posted October 15, 2019, for the Proposed Control Measure for Ocean-Going Vessels At Berth (“Proposed Control Measure”). The Port understands that the California Air Resources Board (“CARB”) plans to replace the current Airborne Toxic Control Measure for Auxiliary Diesel Engines Operated on Ocean-Going Vessels At Berth in a California Port (the current “At-Berth Regulation”) with the Proposed Control Measure, with the goal of taking the Proposed Control Measure to the CARB Governing Board on December 5, 2019 at a special meeting to be held in West Oakland. The Port understands that the CARB Governing Board will not vote on the Proposed Control Measure on December 5, 2019, and that comments are due December 9, 2019.

The Port fully supports CARB’s efforts to reduce emissions from ocean-going vessels at berth and is working diligently to maximize the number of vessel visits using shore power. Port staff work collaboratively with shipping lines to provide education and resources about the shore power program. Port staff track shore power usage in real time, collecting detailed information from marine terminal operators. The Port regularly posts up-to-date shore power usage statistics, reasons for vessels not plugging in, and cost information on the Port’s shore power website: <https://www.oaklandseaport.com/development-programs/shore-power/>.

In 2018, 75% of all vessel calls at the Port of Oakland drew shore power (the number for all vessel calls includes steamships and “infrequent callers” which are both exempt from the current At-Berth Regulation), which surpassed the regulatory requirement of 70% compliance. The plug-in rates at the Port of Oakland continue to increase. For example, in October 2019, 100% of vessels

that were equipped with shore power plugged in and 83% of all vessel calls plugged in. This was the third time in 2019 and the second consecutive month where shore power plug-in rates were above 80%. For 2019, the year-to-date average, including October 2019, was 76%.

The Port has commented on previous drafts of the Proposed Control Measure and various supporting documents, and those previous comment letters are enclosed with this comment letter. The Port appreciates CARB's consideration of its past comments and sets forth its new and continuing comments and concerns below.

### **Comments on Emissions Inventory**

The Port has reviewed Appendix H: 2019 Update to Inventory for Ocean-Going Vessels at Berth: Methodology and Results. This inventory is extremely important, as it lays the foundation for the need for, and cost-effectiveness of, the Proposed Control Measure.

The Port appreciates all the hard work that went into the inventory, and the willingness of CARB staff to attempt to explain their methodology. At the same time, Port staff (along with other public seaport authorities and shipping partners that operate in the State) have struggled to understand the inventory results and implications for both Oakland and the State as a whole. Based on the collective feedback that has been received from stakeholders, CARB staff continues to revisit the baseline and forecasted emissions assumptions with updated calculations and results even as this Proposed Control Measure is being put before the CARB Governing Board. In other words, the methodology and analysis upon which the Proposed Control Measure is based, are still in flux.

To highlight just one particularly notable example, the 2020 estimated total hours at berth divided by typical call durations by vessel size indicate that there will be 2,580 calls for the Port of Oakland in 2020, which is a dramatic departure and increase (a deviation of over 40%) from observed operational realities and shipping trends. For context, the Port of Oakland had 1,175 calls in the first 10 months of 2019, 1,543 calls in 2018, and 1,598 calls in 2017. The same calculation applied to CARB values for the Ports of Los Angeles and Long Beach predicts 2,405 calls in 2020, which means Oakland would see 175 more calls than the Ports of Los Angeles and Long Beach combined. Such an order of magnitude difference has implications for evaluating the effectiveness and potential impact of the Proposed Control Measure and any marginal benefits that could be achieved by it.

Port staff compared the 2016 baseline values used by CARB in the inventory to 2016 actual values recorded at the Port. It appears that CARB's 2016 values for total time at berth are about 8% higher than actual, and that CARB's estimates for average power by ship size (which were derived from values at the ports of Los Angeles and Long Beach) are about 9% higher than actual for Oakland. Additionally, it seems that CARB has underestimated the total activity for the regulated fleet in 2016 by about 11%, which makes it appear that the Proposed Control Measure overestimates projected reductions. These over- and under-estimates do not balance out. In fact, they lead to further discrepancies which are compounded by CARB's assumed 21.5% growth rate which is applied equally across all vessel size bins. The Port understands that this growth rate was

developed from the Federal Highway Administration’s Freight Analysis Framework and requests that CARB explain how this growth rate applies to hours at berth, cargo volumes, emissions, ship calls, and cost.

The Port appreciates CARB staff’s recent acknowledgment that the cargo growth rate for Oakland needs to be adjusted. Port staff and CARB staff have had multiple discussions about the growth rate issue, and the Port understands that CARB will consider instead the Oakland-specific cargo forecast commissioned by the Bay Conservation and Development Commission (“BCDC”)<sup>1</sup>. This will lower the forecasted annual growth rate for Oakland from ~4.6% to a more realistic, but still high, forecast of 2.2%. For reference, the Port’s historical compounded annual growth rate from fiscal year 2008 to fiscal year 2018 was 0.4%.<sup>2</sup>

We look forward to evaluating the results and implications of these revised forecasts when the technical work is presented at a future date by CARB staff. The Port seeks assurance that no CARB vote will proceed until the emission reduction estimates reflect more realistic growth rates, for example as provided in the BCDC report.

The Port appreciates CARB staff’s willingness to apply an “efficiency factor” that acknowledges efficiency gains produced by moving more cargo on fewer, larger ships. One point of caution is that the layering of percentages makes it extremely difficult to follow the logic and relate CARB’s forecasted activity and emissions to any real-world metrics. Small errors and invalid assumptions with an initial set of data points can be magnified as these results are extrapolated into later forecast years, which lead to unrealistic and unreliable conclusions. The Port understands the complexity of the task, but a regulation as important and expensive as the one being proposed needs to be based on data that can be fact-checked, and must include forecasts that are grounded in factual operational data.

As an alternative, the Port of Oakland prefers and requests that CARB re-evaluate the inventory using 2016 baseline values provided by the Port and a Port-specific growth forecast. The Port further requests that the forecast activity levels be related to ship calls, which can be readily understood by all ports, regulatory agency staff as well as by the public. This would be consistent with how the Port tracks shore power usage and compliance. Lastly, and most importantly, the Port asks that these changes be made and the inventory fully peer-reviewed before the CARB Governing Board contemplates further action on the Proposed Control Measure.

### **Broad Concerns about the Proposed Control Measure**

The Port is extremely concerned that the Proposed Control Measure adds a substantial additional regulatory burden and cost to carriers and terminals that are already achieving high levels of plug-ins and emissions reductions. As the Port has discussed with CARB previously along with other California seaports, CARB could achieve more cost-effective emissions reductions from other source categories. In fact, during a conference call with CARB staff on Friday, November 22,

---

<sup>1</sup> BCDC is currently amending its Seaport Plan for the San Francisco Bay Area.

<sup>2</sup> From Budget and Finance report at May 23, 2019 Port Board Meeting (File ID 098-19), slide 6.

2019, the Port joined its sister ports in proposing potentially preferred emissions reductions project alternatives based upon readily available specific equipment replacements, which will result in a significant reduction of emissions.

A second broad concern is that the Port of Oakland would be disadvantaged under the Proposed Control Measure because it does not have the option of a CARB approved emission control strategy (“CAECS”) other than shore power. As CARB itself found, the Port of Oakland cannot use a barge-based capture and control (“C+C”) method at three of its four terminals “due to concerns expressed from SF Bar Pilots about wave interaction from passing vessels and channel space and navigational constraints.” (See Appendix E: *Berth Analysis*.) The three terminals cited in CARB’s Appendix E (Everport, Matson, and OICT) account for over 83% of the Port’s call volume.

To elaborate, the potential negative impact to the Port and its carriers, tenants, and the community from the Proposed Control Measure is foreseeable. It is well established that almost every vessel calling Oakland also calls the ports of Los Angeles and Long Beach. Unlike Oakland, the ports of Los Angeles and Long Beach can use a barge-based C+C strategy. What will happen if carriers rely on a barge for compliance at the ports of Los Angeles and Long Beach, and then come to Oakland where a barge is not possible? The Port is very concerned that carriers may bypass Oakland if the Proposed Control Measure is enacted as currently written. Oakland has no feasible C+C alternative<sup>3</sup>, which could put the Port of Oakland at a serious competitive disadvantage.

To address the fact that a barge-based C+C will not work in Oakland, the Port requests that CARB grant Oakland exemptions corresponding to the number of calls that rely on barge-based C+C in Southern California.

As a third concern, the Port understands that the Proposed Control Measure anticipates other emission control strategies such as a land-based C+C system. However, the Port is concerned that landside emissions control approaches were never contemplated for use in the container fleets, have not been analyzed by CARB staff for use in the container shipping trades, and by CARB’s own analysis can result in an increase in greenhouse gas emissions<sup>4</sup>, which would seem to be an unacceptable outcome given the purpose and intent of this rulemaking.

The Port’s fourth concern is the introduction of shared responsibility which potentially creates conflict among vessels, terminals, and ports (see Table 5 of Proposed Control Measure) where none now exists. Upon the adoption of the initial At-Berth Regulation, CARB rightly acknowledged that in a global shipping environment it was not reasonable to expect that every vessel in every fleet would be equipped to receive shore power, hence the creation of fleet compliance averages and an exemption for infrequent callers. The Port has seen that its diligent involvement with carriers and terminals has resulted in a continuous positive trajectory in shore power usage.

---

<sup>3</sup> Appendix E of the ISOR, page 12

<sup>4</sup> Appendix C-1 of the SRIA, page 15

The Proposed Control Measure continues the acknowledgement that there will be instances when ships cannot plug in, due to circumstances on the vessel or at the terminal, hence the inclusion of alternative compliance options and a complex regime of Terminal Incident Events (“TIEs”) and Vessel Incident Events (“VIEs”). The Port understands the goal of the TIE and VIE regime, but it creates more problems such as record-keeping and dispute resolution, than it solves. The Proposed Control Measure has no clear grievance or dispute resolution process when conflicts arise

### **Specific Comments on Proposed Control Measure**

1. Regarding the Terminal and Port Plans required for Container terminals in Section 93130.14, the deadline of July 1, 2021 is confusing because the Compliance Start Date listed in Section 93130.7(b) is shown as January 1, 2021. Shouldn’t the Plans and associated 90-day review window be completed prior to requiring compliance?

Port staff object to the text in Section 93130.14(a) that “[a]s an alternative, Ports may submit plans for their terminal operators.” Ports should not be expected to submit plans for terminal operators. In addition, the statement in Section 93130.14(b)(1) that “Ports should use terminal plans as [the] basis for developing port plans” seems to indicate that the deadline for Port Plans should be adjusted to come after the deadline for Terminal Plans.

2. The definition of “Fleet” in Section 93130.2(b)(29) does not explain how fleets will be established. What will CARB require at the beginning of each compliance year to establish fleets? How will this work?

The proposed regulation does not address how or whether VIEs will be granted for new fleets entering the California market, or for fleets that expand. New entrants should be allowed to estimate their annual ship calls and be granted the associated number of VIEs for the coming year. Otherwise, this is a barrier to entry for new fleets because they will be granted zero VIEs in their very first year of operation. This puts California ports at a competitive disadvantage compared to ports in Oregon, Washington, Canada, Mexico, and on the U.S. Gulf and East Coast.

The definition of Fleet and the requirements for VIEs also need to be responsive to changes in the shipping industry, for example when businesses merge or alliances change. It is not clear whether VIEs will be granted on a port-specific or State-wide basis. It is also not clear how disagreements will be resolved on whether a specific instance should use a TIE or a VIE. Will CARB adjudicate these?

3. The Port is glad to see that Vessel Commissioning is specifically exempt from the rule, as listed in visit exception Section 93130.8(c). However, the Port notes that it should not be limited to only the first visit, and should not matter whether the commissioning was successful. What happens if the commissioning was not successful? The Port of Oakland requires that vessels be re-commissioned if they have not been in Oakland for over a year. Further, the same vessel might need commissioning on both port side and starboard side. For these reasons, the same ship might require multiple commissioning trips.

Port staff request that vessel commissioning events that do not successfully connect to shore power as discussed in Section 93130.8(c) be eligible for exceptions under the regulation without the use of a VIE. The commissioning attempt shows that the goal was to reduce emissions through shore power and as such should be an exception in this situation. Port staff conduct each vessel commissioning (with the exception of those at Berths 61-6<sup>5</sup> to ensure the safety of the vessel, terminal, and workforce. Vessel commissioning is an invaluable safety procedure and should not be penalized under the Proposed Control Measure.

The Port requests that the definition of “Vessel Commissioning” in Section 93130.2(b)(76) of the Proposed Control Measure be expanded to include the port authority as the commissioning agent, as is the case at the Port of Oakland. The same language is found in Section 93130.7(e)(2) (“Ensure the vessel is commissioned as required by terminal operator”), Section 93130.8(c)(2) (“The terminal requires that the vessel be recommissioned”), and Section 93130.9(a)(2) “The terminal operator is responsible for commissioning vessels equipped with shore power.”). The commissioning requirement should be determined by the port authority or the terminal operator.

4. The Port requests that the definition of “Ready to Work” in Section 93130.2(b)(55) be expanded to include “Auxiliary Marine Power (AMP) container has been loaded on the ship and is in position, if applicable.” This is crucial for the requirement in Section 93130.9(d)(2)(D) that the vessel be plugged in “within 1 hour of vessel “Ready to Work”.” Many of the ships that call at the Port of Oakland rely on an AMP container to connect to shore power. The AMP container is often domiciled at the terminal and needs to be loaded onto the vessel by a ship-to-shore crane prior to plugging in. Some of the major carriers calling in Oakland rely on an AMP container to use shore power [MOL, NYK, K-Line (the ONE Alliance), Hyundai, and APL]. A vessel is not ready to plug in until the AMP container is in position.

Likewise, the Port requests that the disconnection requirement in Section 93130.9(d)(2)(E) be re-written to accommodate certain situations where the AMP container has been removed from the ship prior to the pilot boarding.

5. The Port appreciates the increase in TIEs to 15% for the first four years of the regulation as listed in Table 3 of Section 93130.11. The Port requests that the number of TIEs and VIEs be rounded *up* to the nearest whole number instead of rounding to the nearest whole number for instances where the number of TIEs or VIEs is calculated at a fraction of ship call as stated in Section 9310.11(a)(2). Any fractional call should be counted as a whole call. For example, if a carrier made 49 calls to a California port in 2019, the VIE calculation

---

<sup>5</sup> The Port does not commission vessels at the Matson Terminal because these shore power vaults were installed by the former tenant, APL. The current terminal operator has assumed responsibility for these vaults.

would award 2.45 VIEs at the 5% level. This should be rounded up to three, not down to two.

6. Regarding the Remediation Fund described in Section 93130.15 of the Proposed Control Measure, what is the procedure and timeline for CARB to approve a public entity to manage the funds generated at the Port? What happens if no Remediation Fund administrator is established per Section 93130.15(a)? Does that mean the Remediation Fund would not be an option?
7. Port staff request further information from CARB on when and where the Remediation Fund will be deployed. Given that CARB anticipates zero-emissions regulation on trucks, transport refrigeration units, forklifts, and cargo-handling equipment in the time frame of enhanced usage of the Remediation Fund, would those categories be ineligible for incentive-funded emissions reductions?
8. Port staff note that the power meter readings required in Section 93130.9(d)(2)(C) and (F) and Section 93130.9(d)(3)(I) are not available until the close of each calendar month. This means that it will often not be possible to report the power usage within seven calendar days of a vessel's departure, as required in the Proposed Control Measure.
9. In Section 93130.1 of the Proposed Control Measure, the stated intent of the Proposed Control Measure is "to reduce oxides of nitrogen (NOx), reactive organic gases (ROG), particulate matter (PM), diesel particulate matter (DPM), and greenhouse gas (GHG) emissions from ocean-going vessels while docked at berth at California ports." How will CARB monitor GHG emissions after implementation of the Proposed Control Measure? What is the GHG emissions baseline?
10. The Port requests that maintenance events of landside shore power equipment be included in Section 93130.9(f) along with "construction or repair" so that maintenance events also have the option of using a TIE.
11. The Port requests that the Proposed Control Measure include an exemption for liquefied natural gas (LNG) powered vessels. This would have the desired effect of incentivizing cleaner ships, which would provide significant emission reductions throughout the ship's voyage, not just the small fraction of time while the ship is at berth in California.

## **Conclusion**

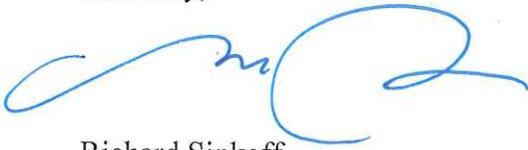

In conclusion, the Port of Oakland is fully committed to reducing emissions, and is proud of the results achieved with its industry and regulatory partners. In fact, the Port is unaware of any other port authority in the world that plugs in as many container vessels on an annual basis as the Port of Oakland. The partnership and collaboration with CARB, the Bay Area Air Quality Management District, and the Port's shipping and marine terminal customers have been a key to the success of

this program. The Port believes that these efforts can be used a model for other states and nations who might seek to reduce localized emission from ships at berth.

Port staff appreciate the opportunity to review and comment on the Proposed Control Measure and attend the public workshop on December 5, 2019. We look forward to continuing to work with CARB towards improving shore power effectiveness, emissions inventories, and associated analyses and to collaborate together to achieve cost-effective and feasible air quality improvements to protect public health.

Comment:

Re: Public Comments Submission In Opposition To Specific Proposed Amendments  
And Requests To Correct And Include Additional Information

Dear CARB Board Members:

The Coalition For A Safe Environment and et all signatory organizations submit these joint public comments on the Proposed Control Measure for Ocean-Going Vessels At Berth Rule Amendments.

We represent a broad base coalition of port community organizations in California and we object to the significant last minute and unacceptable changes to the Proposed Control Measure for Ocean-Going Vessels At Berth Rule. Many of the changes are delays in implementation or compliance which have significant impacts on public health, the environment and climate change. Hundreds of innocent residents and children will die prematurely and hospitalized with the new delays in implementation and compliance. This is an act of Environmental Racism.

12-1

CARB Staff has continuously failed to include 99% of all EJ Community recommendations, requests, information omissions, needed corrections and definitions that have been submitted in writing during the public comment periods. This is an act of Environmental Racism.

12-2

We request that you not approve the Proposed Control Measure for Ocean-Going Vessels At Berth Rule as presented by CARB Staff until the final At Berth Rule includes information corrections, information omissions, additional assessments information, recommendations and requests by the organization in these public comments. CARB Staff ignored 99% of all our concerns, document errors, information omissions, recommendations and requests.

12-2  
(Con't)

See attached complete public comments.

Respectfully submitted,

Jesse N Marquez  
Executive Director  
Coalition For A Safe Environment

Proposed Control Measure for Ocean-Going Vessels At Berth

Re: Public Comments Submission In Opposition To Specific Proposed Amendments  
And Requests To Correct And Include Additional Information

Dear CARB Board Members:

The Coalition For A Safe Environment and et all signatory organizations submit these joint public comments on the Proposed Control Measure for Ocean-Going Vessels At Berth Rule Amendments.

We represent a broad base coalition of port community organizations in California and we object to the significant last minute and unacceptable changes to the Proposed Control Measure for Ocean-Going Vessels At Berth Rule. Many of the changes are delays in implementation or compliance which have significant impacts on public health, the environment and climate change.

12-3

Hundreds of innocent residents and children will die prematurely and hospitalized with the new delays in implementation and compliance. This is an act of Environmental Racism.

12-3  
(cont)

CARB Staff has continuously failed to include 99% of all EJ Community recommendations, requests, information omissions, needed corrections and definitions that have been submitted in writing during the public comment periods. This is an act of Environmental Racism.

12-4

We request that you not approve the Proposed Control Measure for Ocean-Going Vessels At Berth Rule as presented by CARB Staff until the final At Berth Rule includes information corrections, information omissions, additional assessments information, recommendations and requests by the organization in these public comments. CARB Staff ignored 99% of all our concerns, document errors, information omissions, recommendations and requests.

## INTRODUCTION

Ocean-Going Vessels commonly known as ships are one of the largest sources of air pollution at ports. Each ship releases 2-4 tons of air pollution daily while docked at a port terminal. Ships burn the dirtiest petroleum fossil fuel product called Bunker Fuel which is actually a thick liquid oil fuel. Ship emissions come from three sources: Main Engines, Auxiliary Engines and Boilers.

The current At Berth Rule requires that ships must use Electric Shorepower or an Equivalent Alternative Ship Emissions Capture and Treatment Technology. The At Berth Rule does not currently apply to all categories of ships.

Ships today are all not complying with the existing At Berth Regulation especially when there is an unexpected interference such as a union labor agreement strike, port terminal failure to hire sufficient truck drivers to unload cargo, port terminals failure to have sufficient chassis to pick up containers and currently the excuse of the Coronavirus pandemic to intentionally not unload product. CARB Staff has not provided information as to the number of ships currently not in compliance with the At Berth Rule. During this time of the Coronavirus there have been over 30 ships outside of the harbor breakwater at-anchor at the Ports of Los Angeles and Long Beach.

12-5

CARB has continuously failed to protect public health and to enforce the law and existing regulations. Environmental Justice Communities are the most vulnerable populations and most disproportionately impacted. CARB continuously bends over backwards to support ports, big box retailers and the shipping industry by manipulating the At Berth Rule to allow ship category exemptions, unreasonable and unjustified reporting and compliance extension deadlines. This is once again an act of Environmental Racism.

We support California's transition to Zero Emission Freight Transportation and Emission Capture and Treatment Technologies. We cannot meet California's air quality standards and reduce our public health crisis with weak regulations, long implementation dates, no technology certification protocols, allowing mitigation measures that by-pass compliance asap and allowing ship exemptions.

We support AB 32 the Global Warming Solutions Act for the reduction of greenhouse gases as soon as possible. CARB continues to delay the earliest implementation of all feasible mitigation measures in the ports and petroleum industries the two largest polluters in the state of California.

### **Electric Shorepower**

Every major port in California is required to have at least one terminal that offers Electric Shorepower. Ships must be retrofitted to be able to plug into Electric Shorepower and most ships have not been retrofitted or because of the design cannot be retrofitted. Some port terminals only offer shorepower on one end or location of a terminal so cannot be used on all ships.

### **Ship Emissions Capture, Control & Treatment Technology**

There is an current existing and CARB Executive Order approved technology that is using basic vacuum cleaner technology to suck-in ship emissions from ship exhaust pipes and then processes these ship air pollution emissions with a series of filters so that clean emissions are released into the atmosphere. Ship Emissions Capture, Control & Treatment Technology can be built on-dock at a terminal, on a barge which can be maneuvered alongside a ship or on a barge near a ship at-anchor.

The AMECS-Advanced Maritime Emissions Control System was the first Ship Emissions Capture, Control & Treatment Technology to be invented by ACTI/AEG and is approved by a CARB Executive Order that complies with the At Berth Rule. ACTI/AEG owns eight US Technology Patents and is the only company to have built both an on-dock system at a terminal that works and an on-barge system tested At-Berth and At Anchor.

### **Electric Shorepower vs Ship Emissions Capture, Control & Treatment Technology**

Electric Shorepower can only stop and prevent about 50% of ship emissions because shorepower can only connect to the Main Engines Exhaust Pipes. Toxic air pollution is still being released into the atmosphere untreated from Auxiliary Boilers. Boilers are used to heat a ship and crude oil in tanker ships. Ships were not designed to allow extra-large cables and supporting equipment etc. to be added later. Ship Emissions Capture, Control & Treatment Technology can capture and treat 99% of emissions and therefore are more effective than shorepower. A large vacuum hose attached to an extendable articulated arm is connected to the Main Engine, Auxiliary Engines and Boilers exhaust pipes.

## **ISSUES**

### **1. Inadequate Public Comment Period Time & Request For 30 Day Extension Of The Public Comment Period**

CARB added 16 new documents under the title of Additional Reference Documents of which the majority have no specific relevance or contribute no significant value of

information. It is impossible for a member of the public to read over 4,000 pages of new information.

CARB should have devoted its time in counting the number of ships at all California ports currently not complying with the At Berth Rule.

CARB should have devoted its time calculating the toxic emissions ships were illegally releasing when not complying with the At Berth Rule.

CARB should have devoted its time in estimating the public health, environmental and greenhouse gas impacts and costs from these illegal emissions.

CARB's Staff continuing reference to meeting the two year regulation amendment and adoption deadline would not be critical if CARB Staff had not completely rewritten the At Berth Rule in the last 5 months and concentrating in delaying the amendment process for five years.

## **2. The Majority Of New Proposed Revisions Are Attempts By CARB Management and Staff To Support The Private Shipping Industry Making Maximum Profits And To Delay Implementation, A Continuing Historical Example of Environmental Racism**

The Environmental Justice Community and Public have already seen CARB Management and Staff delay the At Berth Rule Amendments 5 years with no justification. Public Health in Disadvantaged Communities and Significant Reductions of Toxic Ship Emissions and Greenhouse Gases continues to be a low priority to CARB.

AB 617 Port Communities have already identified ship pollution as a priority reduction requirement in their CERP's (Community Emissions Reduction Plans). CARB has NO LEGAL AUTHORITY to grant any exemptions or extensions of time that it cannot legally validate.

The Environmental Justice Community and Public only requested 4 basic changes:

Commented [J1]:

- That the regulation include all categories of ships with no exemptions
- That the regulation be adopted asap
- That there be no extensions of dates or time to comply with Rule requirements
- That CARB create a standardized industry technology certification protocol

## **3. Major Amendments Were Made That Were Not Requested by EJ Organizations, The Public & CARB Board Members**

CARB management and staff made amendments that were not requested by the EJ Community or the Public nor were they directed by CARB Board members during the public hearings.

CARB management and staff illegally accepted public comment from the shipping industry after the public comment deadline of May 1, 2020 and incorporated some of the shipping industries requests into the current proposal. The purpose of this CARB Informational Hearing is to try to cover up this illegal action by the CARB staff. The public was not allowed or advised they could continue to submit additional public comment.

The majority of Environmental Justice Community and Public Comments that were submitted were not included in the current Amendments.

12-6

#### **4. We Want CARB Approved Ship Emissions Control Technology Certification Requirement No Strategy**

We want to replace the current CARB inappropriate technology approval process of using an Executive Order and want an industry standardized CARB Approved Ship Emissions Control Technology Certification Requirement. EO's allow personal bias, industry and political influence to interfere and approve less qualified companies which is occurring now.

We want no discretionary Executive Officer approval. A technology Applicant either passes or fails a CARB Approved Ship Emissions Control Technology Certification Protocol and Requirements.

A Strategy is only a Goal as clearly stated in all Dictionaries. A Strategy is not a requirement, condition or control measure. We want clearly defined and certified Ship Emissions Technology Control Certification Requirement and Mitigation Measures.

We want all references to CARB Approved Emission Control Strategy (CAECS), emission control strategy, innovative concept and innovative concept compliance terminology to be replaced throughout the regulation with CARB Certified Approved Ship Emissions Control Technology.

The regulation states that, "To receive CARB approval, a person must demonstrate that the emission controls strategy achieves emission ..... The word person must be replaced with "Technology."

#### **Current Available Technologies:**

- A. On-Dock Ship Electric Shorepower
- B. On-Dock Stationary Emissions Capture, Control & Treatment Technology (AMECS)
- C. At-Dock At Anchor Ship Barge Emissions Capture, Control & Treatment Technology (AMECS). Ship is docked but the barge is alongside the ship.
- D. At-Anchor Ship Barge Emissions Capture, Control & Treatment Technology (AMECS) Ship is not docked but anchored in the harbor.

#### **Available In 2020:**

- A. At-Dock Tanker Ship SPUD Barge Emissions Capture, Control & Treatment Technology (AMECS)
- B. At-Anchor Tanker Ship SPUD Barge Emissions Capture, Control & Treatment Technology (AMECS)

**Future Potential Technologies:**

- A. At-Anchor Ship Barge Zero Emissions Electric Fuel Cell Power
- B. Ship On-Board Emissions Capture, Control & Treatment Technology

**5. We Want A CARB Ship Emissions Control Technology Certification Protocol and Procedures**

We are not here to play games or here to allow CARB to continue to obfuscate its responsibilities of failing to establish badly needed standardized shipping industry Technology Certification Requirements, Compliance Protocols and Testing Procedures.

We additionally request that CARB include in the Certification Requirements that the manufacturer and/or seller provide evidence of ownership of technology patents or permission to use Emissions, Capture, Control and Treatment Technologies. CARB has issued an EO's to a company that does not own the patents or rights for its technologies and allowed that they also be awarded CARB grant subcontracts.

The regulation requires a manufacturer to provide a Warranty but Carb Staff is currently waiving those requirements and allowing a company to continue to operate out of compliance and in violation of a CARB Executive Order and CARB Subcontract requirements. i.e. Port of Los Angeles Green OMNI Terminal Project - Clean Air Engineering-Maritime, Inc. Marine Exhaust Treatment System (METS-1) and ShoreKat System.

**6. We Want All Ports & Terminals To Have Specific Compliance Requirements In The Regulation**

CARB staff has created unacceptable non-compliance schemes such as TIE's and VIE's for Ports and Terminals to avoid planning their ship compliance needs in advance, budgeting funds in advance, ordering adequate equipment in advance, building electric utility infrastructure in advance and purchasing sufficient equipment in advance.

12-7

Ships are required to file an Inward Forwarding Manifest with the U.S. Customs and the average ship travel time to the US is 10 days. So Ports and Terminals know in advance when a ship will arrive.

Reference: 19 CFR § 4.7a - Inward manifest; information required; alternative forms

**(xv)** Date of departure from foreign, as reflected in the vessel log (this element relates to the departure of the vessel from the foreign port with respect to which the advance cargo declaration is filed (see § 4.7(b)(2) or § 4.7(b)(4)); the time frame for reporting this data element will be either:

**(A)** No later than 24 hours after departure from the foreign port of lading, for those vessels that will arrive in the United States more than 24 hours after sailing from that foreign port;

The Ports and Terminal Operators can list 99% of all possible worst case scenarios and prepare emergency back-up contingency plans today now.

These are CARB Management and Staff elaborate schemes to allow ships to continue to maximize their profits, pollute our air and waters and allow significant Public Health Impacts to continue in our communities.

12-7

#### **7. Applicability Shall Refer To A CARB Ship Emissions Control Technology Certification Protocol/Procedure**

We do not except the meaningless CARB staff proposed CARB Approved Emissions Control Strategy. We want a CARB Ship Emissions Control Technology Certification Program, Protocols and Procedures to be referenced.

We want all responsible parties, the ports, terminal operators, ships and third party testing companies to be held jointly and severally liable for violating this Control Measure. We do not accept Staffs wording of "may be held Liable." Again another CARB staff attempt to minimize enforcement in EJ Port Communities.

#### **8. We Want No Ship Category Exemptions For Dry Bulk, Break Bulk Or General Cargo Ships**

CARB staff was directed by CARB Board Members at the December CARB Meeting to include Dry Bulk, Break Bulk and General Cargo Ships but staff has failed to include them in Table 1. CARB was presented an engineering firms data in December showing the significant amount of emissions of Dry Bulk, Break Bulk and General Cargo Ships and staff has not provided any evidence or data to validate an exemption.

The following Table 22 illustrates that Bulk Ships are a significant Emissions Source and what the immediate benefits would be under the amended At-Berth Rule.

**Evaluation of the  
Advanced Maritime  
Emissions Control  
System (AMECS)**

AMECS Demonstration  
at the Port of Long  
Beach, California

**Table 22. Emissions Reduced per Vessel**

Vessel Type	PM <sup>1</sup> ton/yr	NOx ton/yr	VOC ton/yr	TOTAL <sup>2</sup> ton/yr	SOx <sup>3</sup> ton/yr
Auto Carrier	135.8	72.7	2.4	210.9	70.2
Bulk	42.3	22.9	0.8	65.9	21.6
Container Ship	242.0	135.0	4.5	381.5	117.4
General Cargo	34.7	17.2	0.6	52.5	19.8
Passenger	386.7	197.4	6.2	590.3	164.9
Reefer	194.8	106.8	3.6	305.2	97.3
Roll-on/Roll-off	102.7	61.1	2.0	165.8	44.5
Tanker	237.2	74.4	2.8	314.4	197.0

<sup>1</sup> Moyer weighting factor of 20 was applied to the PM emissions reduced.

<sup>2</sup> Total emissions only include PM, NOx, and VOC for cost effectiveness calculations.

<sup>3</sup> SOx emissions reduced is provided in this table for informational purposes only.

Examples where Tables exclude Break Bulk Ships:

Table 1: Compliance Start Dates by Vessel Type	
January 1, 2021	Container and refrigerated cargo vessels
January 1, 2021	Passenger vessels
January 1, 2024 <del>2025</del>	Roll-on roll-off vessels
January 1, 2025 <del>2027</del>	Tanker vessels that visit the ports of Los Angeles or Long Beach
January 1, 2027 <del>2029</del>	All remaining tanker vessels

- A. Container Ships
- C. Tanker Ships
- D. Dry Bulk Carrier Ships
- E. General Cargo Ships
- F. RORO-Roll-On Roll-Off Ships
- G. Passenger-Cruise Ships

CARB staff also did not include Dry Bulk, Break Bulk and General Cargo Ships in Terminal Plans. Reference: Section 93130.14. Terminal and Port Plans and Interim Evaluation

CARB staff also did not include Dry Bulk, Break Bulk and General Cargo Ships in Table 4: Remediation Fund Hourly Amount.

<b>Table 4: Remediation Fund Hourly Amount</b>		
<b>Vessel Type</b>	<b>Hourly Remediation Payment Beginning in 2021*</b>	
	<b>Normal Rate</b>	<b>Tier III Rate</b>
<b>Container, Reefer, Ro-ro</b>	\$1,900	\$1,100
<b>Tanker with electric pumps</b>	\$1,600	\$1,000
<b>Tanker with steam driven pumps</b>	\$3,400	\$2,700
<b>Passenger vessels with capacity under 1,500 combined passengers and crew</b>	\$5,300	\$3,200
<b>Passenger vessels with capacity of 1,500 or more combined passengers and crew</b>	\$12,000	\$7,100

CARB staff also did not include Dry Bulk, Break Bulk and General Cargo Ships in Table 5: Innovative Concept Application Due Date.

<b>Table 5: Innovative Concept Application Due Date</b>	
<b><u>Vessel Type</u></b>	<b><u>Due Date</u></b>
<b><u>Container/ Reefer</u></b>	<b><u>July 1, 2021</u></b>
<b><u>Passenger</u></b>	<b><u>July 1, 2021</u></b>
<b><u>Ro-ro</u></b>	<b><u>December 1, 2021</u></b>
<b><u>LA/LB Tankers</u></b>	<b><u>December 1, 2021</u></b>
<b><u>Other Tankers</u></b>	<b><u>December 1, 2021</u></b>

**9. We Want Ship Emissions Compliance At All Ship Locations**

- A. At-Dock
- B. At-Anchor In Port Waters
- C. At- Anchor Outside Of Break Water
- D. At-Anchor In California Coastal Waters

**10. We Do Not Want CAPCOA To Be A Remediation Fund Administrator, CARB Has This Responsibility Or A Qualified Mitigation Non-Profit Foundation**

We do not want CAPCOA or an Air District to be a Remediation Fund Administrator and we do not approve of the use of an unenforceable and unappealable Memorandum of Understanding or "similar agreement". We want a legal signed contract between all parties.

CAPCOA and Air districts have not supported EJ Communities Proposals, Requests, Recommendations, Appeals and Lawsuits 90%+ of the time in the past.

The Harbor Community Benefit Foundation in San Pedro in Southern California and the Rose Foundation in Oakland in Northern California are qualified to administer this Remediation Fund.

**11. We Want No Extension Of Originally Proposed Dates Or Times Compliance Requirements**

CARB staff has proposed numerous date and time extensions which are not necessary.

**12. We Want CARB To Establish Minimum At Berth Rule Port Responsibilities Information Requirements**

We do not want to wait for Ports to take 2-3 years to develop their responsibilities. We want CARB to hold 2-3 public hearings within 6 months to develop preliminary Port Responsibilities. They can be fine-tuned by ports who may have some special circumstances.

**13. We Want No At Berth Rule Interim Requirements**

Any and all requirements must be mandatory and clearly defined. We want no waivers, variances and extensions for non-certified technology. There can be an approved Pilot Project or Test Demonstration in preparation for final CARB Certification.

**14. We Want The At Bert Rule To Include MARPOL ANNEX VI & XIII Engine Requirements & For Ships To Provide Certificate Information**

International Air Pollution Prevention Certificate (IAPPC)

Engine International Air Pollution Prevention Certificate (EIAPPC)

**15. We Want The AT Bert Rule To Include The U.S. EPA North American and U.S. Caribbean Sea Emissions Control Areas Penalty Policy for Violations by Ships of the Sulfur in Fuel Standard and Related Provisions**

The regulation fails to reference and include all international IMO ship mandatory requirements and penalties. We request that CARB research and include all applicable IMO requirements for inclusion in this regulation.

## **16. We Want PM Emissions Standards & Compliance Data In Addition To Opacity Requirements**

There is no definition of Opacity and Opacity Requirements. It essentially means how dark is the black smoke that you see and the volume. You cannot see or see clearly the smoke in the rain, on a foggy day and at night.

Opacity Requirements require a person to take a class and having opacity charts/scales to look at or to confirm an observation. So there is some personal opinion and best judgement allowed

We want to include CARB PM Standards and Testing Requirements included in the regulation.

## **17. We Do Not Want To Expand Use Of Vessel and Terminal Incident Events (VIE's and TIE's) To New & Growing Vessel Fleets & Terminals**

All Ports, Terminal Operating and Shipping Industry have known and will know all new AT Berth Rule Requirements. All Ports and Terminal Operators have had a minimum of five years to prepare for the expansion of the At Berth Rule.

CARB staff has created acceptable non-compliance schemes such as TIE's and VIE's for Ports and Terminals to avoid planning their ship compliance needs in advance, budgeting funds in advance, ordering adequate equipment in advance, building electric utility infrastructure in advance and purchasing sufficient equipment in advance.

These are CARB Management and Staff elaborate schemes to allow ships to continue to maximize their profits, pollute our air and waters and allow significant Public Health Impacts to continue in our communities.

99% of all possible worst case scenarios are already known, can be listed and can be prepared for now, so there is no excuse to not be ready with back-up emergency power, additional emissions control and treatment technologies and including complete shut-down protocols.

All required ship forms, documentation and report requirements already exist, are on-line and there will only be a few changes and updates. 90%+ of all ship forms, documentation and reports can be prepared in advance before arrival at a port.

## **18. CARB's Reference To A Second Qualified Ship Emissions Capture & Control Technology Company Is A Fraud & Example of CARB Management Discrimination Against A Superior Minority Owned Technology Company**

## **19. The Definitions Of Words Has Words That Are Not Defined In The Definitions**

As one example: The definition of Anchorage includes the words “moor” and “California waters,” but there are no definitions of these words.

The average person does not know what the word moor means and does not know how far out in the ocean is the California water boundary.

CARB's failure to include all important word definitions is an attempt to deceive the public as to how far outside a breakwater the At Berth Rule applies. Ports do not want any responsibility to acknowledge, identify, quantify and mitigate ship emissions outside the port. During the Covid-19 Pandemic and other events such as the Ports of Los Angeles and Long Beach ILWU union strikes and ports failures to assure that Terminal Operators had sufficient truck drivers and container chassis resulted in over 30 ships being “At-Anchorage or At-Anchor” outside the breakwater. Ships did not plug-in or use alternative ship emission control, capture and treatment technology so 100's of tons of ship air pollution went unmitigated and public health was negatively impacted. CARB, the AQMD's and Ports took no corrective or remedial action whatsoever.

The term At Anchor is used more often than At Anchorage and should also be included in the definitions.

We want the requirement and definition of Certification to be included in the definitions.

## **20. CARB Staff Has To Stop Making Up Definitions That Confuse The Public & Use Governmental Agency Or Industry Definitions**

CARB staff needs to clean-up definitions. There are numerous errors and omissions.

There is no definition for IMO and does reference all the mandatory worldwide ship requirements that are applicable in this At Berth Rule.

The rule defines Remediation Fund but has no definition of Remediation.

There is a Tanker Boiler definition but fails to state that all ships have and use Boilers. Tanker Ship Boilers are also the largest source of emissions.

There is a Utility definition that is not correct or accurate. One accurate definition of Electric Utility is: An electric utility is a company in the electric power industry that engages in electricity generation and distribution of electricity for sale generally in a regulated market. Where does staff get the word “any person engaged in...?”

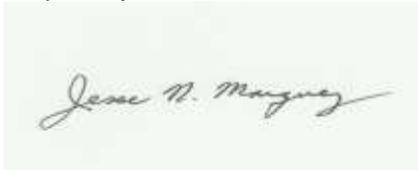

We want a review of all word definitions and all words contained in this regulation.

## **21. CARB Staff has Proposed No Enforcement, Penalties And Fines Section**

We want a chapter or section that clearly outlines and describes CARB's Enforcement, Penalties And Fine Responsibilities.

For additional information the primary contact is Jesse N Marquez for these public comments.

Respectfully Submitted,

Re: WSPA Comments on Second “15-Day Changes” to CARB Proposed Control Measure for Ocean-Going Vessels at Berth

To the Clerk of the Board:

This letter supplements comments previously submitted by the Western States Petroleum Association (“WSPA”) on the California Air Resources Board’s (“CARB”) Proposed Control Measure for Ocean-Going Vessels at Berth (“Proposed Regulation”) and its various amendments since its original release on October 15, 2019. WSPA is a non-profit trade association representing companies that explore for, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California and four other western states.

WSPA is providing these comments in specific response to the Second 15-Day Changes, and as part of a continuing effort to provide feedback on the Proposed Regulation. We incorporate our previous comments submitted on February 15, 2019; March 29, 2019; May 30, 2019; June 14, 2019; August 15, 2019; December 3, 2019; March 6, 2020; and May 1, 2020 by reference herein.

## **I. Summary of Concerns with Second 15-Day Changes**

- The Second 15-Day Changes propose to extend the compliance start dates for container vessels, refrigerated cargo vessels, passenger vessels and roll-on roll-off (“ro-ro”) vessels, but arbitrarily exclude tankers from any compliance schedule relief – based on an incorrect and unsupported claim that the tanker industry has “recovered” from the pandemic. The Second 15-Day Changes must be further revised to provide the lead time necessary for industry to recover from the nation’s current severe economic recession and to conduct the feasibility studies necessary to ensure that new international safety standards are adequately considered, and that tankers are not put at unacceptable risk of explosion or other serious threats to safety.
- The proposed extension of the maximum “Innovative Concepts” compliance period from three years to five years in the Second 15-Day Changes fails to make “Innovative Concepts” a viable compliance alternative for tanker terminals.
- The proposed changes to the “interim evaluation” provisions fail to provide for the feasibility study critically needed for tankers before the Proposed Regulation is adopted.
- The Second 15-Day Changes assume no changes to projected emissions and economic activity in the face of the pandemic, relying instead on increasingly unrealistic and outdated assumptions about future business levels, emissions and potential environmental benefits of the amendments.

- A draft report for a CARB-commissioned study on real-world tanker emissions – “Emissions Evaluation of a Large Capacity Auxiliary Boiler on a Modern Tankers,” dated March 2020 – was made available to WSPA for the first time in early July. The results indicate that Staff’s tanker NOx emissions factor overstates the actual real-world factor by **233%** and overstates the actual tanker PM2.5 emission factor by **2,288%**. Despite these significant inaccuracies in Staff’s assumptions, Staff have not accounted for the findings of this study in the Second 15-Day Changes.

## **II. Adjustments in Compliance Start Years for Regulated Vessels Should Not Arbitrarily Exclude Tanker Vessels**

The Second 15-Day Changes propose adjusting the compliance start dates from 2021 to 2023 for container vessels, refrigerated cargo vessels, and passenger vessels, and from 2024 to 2025 for ro-ro vessels. See Proposed 17 C.C.R. § 93130.7(b). Staff noted that these proposed changes were made “in order to give registered entities additional time to prepare for compliance in light of the current economic downturn.” CARB Second Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information (“Second Notice”), p. 9.

Staff’s claims about “past recession events” do not appear to be supported by actual evidence in the record, nor is it clear what data justify Staff’s assertions about the predicted future “recovery” of tanker vessel visits. Staff provide no evidence in the supporting materials for the Second 15-Day Changes to justify not also affording tanker vessels additional time for compliance. Indeed, in the Second Notice, Staff concede that all of the regulated vessel categories are seeing emissions reductions due to the serious reduction in economic activity and vessel visits attributable to the pandemic, and that all categories will take years “to recover to pre-recession visit levels.” Second Notice, p. 18.

The only indication given as to why tankers are being treated differently came in Staff’s slide presentation to the Board on June 25, 2020, during which Staff claimed that “we’re already starting to see increases in crude imports in May and June, and demand is expected to continue recovering as more people resume normal daily operations. See Transcript of CARB Videoconference Meeting, June 25, 2020 (“Transcript”), p. 329:18-23. But Staff have yet to present the data on which they purport to rely, making it impossible to assess the veracity or accuracy of their statements. Moreover, since the June Board meeting, the resurgence of COVID-19 cases in California has prompted the re-imposition of strict state and local responsive measures, including widespread business closures. Under these circumstances, people are not resuming normal daily operations now or any time soon, and demand cannot be expected to continue recovering.

The available data show that, contrary to Staff’s claim, the tanker industry is suffering significantly from the economic collapse right along with other vessel categories. Energy Information Administration (“EIA”) data through April 2020 show that PADD 5 crude imports, which are dominated by California, have fallen 46% since December 2019. See <https://www.eia.gov/dnav/pet/hist/LeafHandler.ashx?n=PET&s=MCRIMP51&f=M>. Furthermore, California Energy Commission data show that, compared to 2019 inputs during the same timeframe, California refinery crude inputs were down between 25 and 30 percent during May and June 2020, and down by 32% as of July 17.<sup>1</sup> As the graphs in Tab 2 show, though they are not as low in July 2020 as they were in early May 2020, week to week U.S. crude imports and

---

<sup>1</sup> CA Energy Commission Weekly Fuels Watch Report, accessed July 23, 2020 at [https://ww2.energy.ca.gov/almanac/petroleum\\_data/fuels\\_watch/index cms.html](https://ww2.energy.ca.gov/almanac/petroleum_data/fuels_watch/index cms.html) (attached at Tab 1).

exports in 2020 are still far below averages seen in 2019.<sup>2</sup> Total monthly visits of foreign tankers into Southern California ports and terminals went from 35 total visits in January 2020 to just 23 in May and in June 2020, a drop of 34.3%. These same tanker visits as of mid-July were at only 13, tracking for another very low month in July.<sup>3</sup> These data translate to significant reductions in tanker traffic not accounted for in Staff's tanker traffic projections or emissions totals, and stand in direct conflict to Staff's suggestion that the tanker industry is somehow "recovered" from the COVID-19 downturn.

But even if crude imports *were* seeing minor increases at times in May and June 2020, levels of recent activity do nothing to make at-berth capture and control feasible or safe for tanker vessels in the timetables provided in the Proposed Regulation. As we and others have explained in detail in numerous prior comments, the types of emissions capture and control equipment that would be required for tankers in the current Proposed Regulation still have not been proven safe and feasible in real-world operations with tankers at marine terminals. This makes both the original 2027/2029 compliance dates, and the accelerated 2025/2027 compliance deadlines from the First 15-Day Changes, unrealistic and potentially dangerous to attempt to meet, even if eventually determined to be feasible sometime in the future. Indeed, CARB heard undisputed public testimony at the June Board meeting that failing to follow stringent safety measures in managing gases in tanker cargo spaces at berth can lead to catastrophic explosion and loss of human life, as it has in prior real-world incidents. See Transcript, pp. 364-365 (testimony of Capt. Saul Stashower). This issue *alone* warrants giving ports and terminals additional time to conduct necessary feasibility studies in order to determine whether and how at-berth capture and control could be accomplished without risking people's safety.

15-1

The safety concerns associated with tankers – and the critical need to fully understand and account for them in *any* regulation impacting tankers – are further underlined in the new Sixth Edition of the International Safety Guide for Tankers and Terminals ("ISGOTT"), published in June 2020. See "International Safety Guide for Tankers and Terminals," International Chamber of Shipping, *et al.* (6<sup>th</sup> ed. 2020) (attached at Tab 4). The ISGOTT is "widely recognised as the definitive best practice guidance on tanker safety and pollution prevention" (ISGOTT, p. iii), and compliance with ISGOTT measures is mandated under several California statutes and regulations. See California Building Code (Title 24, C.C.R.), Ch. 31F (Marine Oil Terminal Engineering and Maintenance Standards ("MOTEMS") requiring marine oil terminals to meet various ISGOTT standards); 2 C.C.R. §§ 2340(c)(29), 2355(a) (State Lands Commission safety requirements for tanker operations to meet specified ISGOTT provisions). The latest ISGOTT now contains a new Chapter 8 with guidelines on due diligence steps that are to be taken before technologies not yet adopted in the tanker and terminal sector are applied to tankers. Among these diligence steps are directions to review a proposed technology's interface with the vessel's existing systems and processes, preparation of formal risk and impact assessment plans, a study of hazards presented by the new technology, evaluation of consistency with other industry and classification society standards, and analyses of tanker and terminal personnel safety. See ISGOTT, Ch. 8 (Tab 4). ISGOTT Chapter 8 highlights the critical need to assess alternative and emerging technology to ensure that its introduction does not negatively impact tanker and marine

---

<sup>3</sup> July 2020, Marine Exchange of Southern California, "Major Ship Types By Count; 1-15 July 2020" (attached at Tab 3).

oil terminal safety. These important ISGOTT guidelines reinforce the safety concerns that we have documented throughout this rulemaking process.

15-2

In adhering to the ISGOTT guidance, tanker operators also rely on direction, guidance and approvals for regulatory and standards compliance from classification societies like the American Bureau of Shipping (ABS), a “recognized organization” by the United States Coast Guard and International Maritime Organization (IMO), and member of the International Association of Classification Societies (IACS) with consultative status at the IMO. The ABS has issued a guidance document relating to the numerous steps required to assess feasibility of any new technology on marine vessels before the technology can be adopted for real-world use, including engineering evaluations, risk assessments, engineering designs, creation of a manufacturing plan and quality assurance requirements, functional and model testing, prototype validation, systems integration testing, and ABS review. See ABS, “Guidance Notes on Qualifying New Technologies” (April 2017) (attached at Tab 5) (“ABS Guidance”). These safety, risk and other assessments cannot be short-cut or postponed for a later day. As the ABS Guidance points out, “[t]he qualification activities within each stage employ risk assessments and engineering evaluations that build upon each other in order to determine if the new technology provides acceptable levels of safety in line with current offshore and marine industry practice.” In other words, we cannot simply skip to the “operational stage” without first completing the first stages in the ABS Guidance – *i.e.*, feasibility, concept verification, prototype validation and systems integration.

The record contains no indication that Staff have even reviewed the requirements of the ISGOTT or the ABS Guidance in preparing the Proposed Regulation, let alone evaluated whether the Proposed Regulation meets the due diligence and risk assessment requirements of the ISGOTT. Again, additional time should be provided in the compliance schedule for tankers, as it has for other classes of vessels, in order to allow Staff the time necessary to ensure that the Proposed Regulation takes the new ISGOTT guidelines and the ABS Guidance into consideration. These guidance materials also constitute new information that CARB must take into account in the analysis of hazard impacts in the Final Environmental Assessment for the Proposed Regulation.

15-3

In light of the catastrophic economy-wide impacts of the pandemic, and given the many serious safety concerns that the Proposed Regulation continues to raise for the tanker category, it would be arbitrary and capricious for CARB to adopt changes granting additional time for compliance for all other regulated marine vessel classes “in light of the current economic downturn,” but not for tankers. Building in this extra time is crucial to ensuring that CARB does not rush to force impracticable and potentially dangerous requirements on tankers, terminals and ports.

### **III. The Extension of the Maximum “Innovative Concepts” Compliance Period from Three to Five Years Does Not Make It a Viable Compliance Alternative**

The Second 15-Day Changes also propose extending the time during which an “innovative concept” may be used for compliance from a maximum of three years to a maximum of five years. See Proposed 17 C.C.R. §§ 93130.2(b)(21), 93130.17(a)(7). Staff remarked in the Second Notice that the proposed change is intended “to allow more certainty to innovative concept projects to be used for compliance under the Control Measure.” Second Notice, p. 14.

As we and others have explained in prior comments, the proposed “Innovative Concepts” provisions do not provide the true compliance alternative stakeholders requested – *i.e.*, a compliance option *in lieu of* the currently unworkable requirement to install and operate yet-unproven at-berth capture and control systems. At best, an “Innovative Concept” would provide

a temporary **additional** compliance obligation for stakeholders who choose the option, and after a defined maximum period of time, stakeholders *still* would be required to meet the requirement to install a capture and control system or provide shore power.

Changing this maximum time from three to five years does not address the core problems with the “Innovative Concepts” provisions. Most fundamentally, the Second 15-Day Changes fail to provide any relief from the running deadlines to install at-berth shore power or capture and control systems. Once one or more five-year “Innovative Concept” periods come to an end without CARB renewal (or during such a period if CARB decides to revoke an “Innovative Concept”), stakeholders then would become **immediately** subject to the default 2027/2025 deadlines to install a capture and control system. Far from providing more incentive to tanker terminals to choose the “Innovative Concept” option, a five-year project period would actually provide **less** incentive by increasing the amount of lost investment from funding the Innovative Concept over five years, while leaving the stakeholder with little or no time to install capture and control by the now-accelerated default regulatory deadlines.

#### **IV. The Second 15-Day Changes to the Interim Evaluation Provisions Do Not Substitute for a Proper Feasibility Study**

The Second 15-Day Changes also propose that in the envisioned “interim evaluation” of available control technologies and infrastructure for tankers and ro-ro vessels, CARB Staff will not only review “potential requirements for control technologies for use with bulk and general cargo vessels, and for ocean-going vessels at anchor,” but now also the “control technologies” themselves. See Proposed 17 C.C.R. § 93130.14(d). Staff notes that “[t]his change clarifies that CARB will focus on what technologies are available, and will consider potential requirements for these specific vessel categories (rather than requirements for the control technologies themselves).” Second Notice, p. 14.

The proposed changes to subsection 93130.14(d) do not make the “interim evaluation” an adequate substitute for an actual tanker feasibility study done prior to adopting the Proposed Regulation. As discussed above, Chapter 8 of the June 2020 ISGOTT update provides that all aspects of a proposed technology’s feasibility and safety – including hazards analyses, workability of the proposed interface with existing vessel systems, consistency with classification society and industry standards, and potential risks to tanker and shore-side personnel – must be reviewed **before** implementing the proposed technology, not **after**. See ISGOTT, Ch. 8 (Tab 4).

Throughout this entire rulemaking, WSPA has been urging Staff to conduct a feasibility study concerning the viability and safety of installing capture and control systems for use with tankers, and to assess the results of this study before imposing requirements on tanker vessels. Yet, as currently proposed in the Second 15-Day Changes, section 93130.14(d) would require Staff to publish its report on tanker control technology by December 1, 2022 – nearly two years after portions of this Regulation become effective and a year after tanker terminals are required to submit terminal plans describing how they will comply with the Proposed Regulation.

The Second 15-Day Changes do not remedy the problem by directing that Staff evaluate both the “potential requirements” for control technologies and the “control technologies” themselves. We agree that these are critically important questions for determining whether and how tanker terminals can safely and feasibly comply with the Proposed Regulation. But they need to be answered **before** imposing mandatory compliance deadlines on stakeholders, not two years **later**.

**V. The Second 15-Day Changes Fail to Account for the Massive Economic Disruptions and Changes in Projected Emissions Attributable to COVID-19**

In the Second 15-Day Changes, while Staff finally acknowledge the existence of the coronavirus pandemic, they believe it merits no changes at all to predictions of future economic and vessel activity, likely future emissions, or anticipated health outcomes. According to Staff, “[b]ecause the current circumstances are unique from past recession events, CARB staff expect there may be a reduction in emissions to continue over the next few years from reduced vessel visit activity but outcomes are unknown. Therefore we did not make changes to our inputs or methodologies at this time.”<sup>4</sup> Second Notice, p. 18.

California law prohibits Staff from simply assuming away the most serious national economic calamity since the Great Depression. The Health and Safety Code authorizes CARB to adopt regulations only after finding that they are necessary, technologically feasible, and cost effective given the information made available to CARB Staff. Cal. Health & Safety Code §§ 39602.5(a), 43013(a). California Government Code Section 11346.3(c) further requires the Standardized Regulatory Impact Analysis (SRIA) in this rulemaking to conduct a full analysis of the potential of the Proposed Regulation to impact the creation or elimination of jobs, business, investment and innovation in the California economy, along with an accurate assessment of the health, safety and welfare benefits of the regulation. Cal. Gov. Code § 11346.3(c)(1).

Deciding that the most significant reduction of economic activity in a generation should result in **zero** change to Staff’s pre-pandemic economic and emission assumptions defies logic and is plainly arbitrary and capricious. It allows this rulemaking to proceed on now increasingly inaccurate and unreliable projections of future tanker and other vessel activity in California’s ports and terminals over the next several years. By refusing to account for reduced vessel activity in the future, Staff are choosing to rely on considerably overstated future emissions projections, leading to unrealistically high potential health impacts and, in turn, overstated promises of health benefits. Also, as discussed below, Staff’s failure to disclose recent empirical data on tanker emissions has resulted in even further exaggerated and inaccurate projections for future tanker emissions.

A slower national and California economy over the next several years will very likely lead to reduced vessel trips and growth of vessel traffic over that period. Fewer vessel trips at California ports and terminals will mean lower at-berth emissions. At the very least, this could substantially change Staff’s estimates of the potential health benefits of this measure (likely lower) and the cost-effectiveness of the Proposed Regulation (likely much less cost-effective). Staff are not entitled to ignore these impacts.

The public is not well-served when CARB Staff indulge exaggerated or unrealistic projections of future emissions. As the Legislature has pointed out, “[i]naccurate [emissions] inventories that do not reflect the actual emissions into the air can lead to misdirected air quality control measures, resulting in delayed attainment of standards and unnecessary and significant costs.” See Cal. Health & Safety Code § 39607.3(d). Just because future “[o]utcomes are unknown” does not give CARB Staff permission to ignore them entirely. It is CARB’s legal duty to accurately and fairly assess what impacts the coronavirus pandemic will have on future economic activity and vessel trips at California ports and terminals. Only then can CARB understand the true future emissions

15-4

<sup>4</sup> Notably, Staff found “past recession events” instructive when granting all vessel classes but tankers relaxed compliance schedules, but apparently of no guidance whatsoever in requiring changes to assumptions of future vessel activity, emissions or health outcome assumptions. See Second Notice, p. 18.

impacts of vessel traffic, and therefore, the potential impacts of the proposed measures on health and the actual cost-effectiveness of the Proposed Regulation.

#### **VI. Staff Have Failed to Consider Making Changes to Tanker Emission Assumptions Considering the Compelling Results of a CARB-Commissioned Independent Study on Real-World Tanker Emissions**

The Second 15-Day Changes fail to account for, or even acknowledge, a 2019 study commissioned by CARB on in-service tanker emissions – a study that shows a drastically lower emission factor for tankers than the factor on which Staff are currently relying. In 2019, CARB commissioned engineers at the University of California, Riverside, Bourns College of Engineering Center for Environmental Research and Technology (“CE-CERT”) to conduct a study to evaluate real-world emissions from a modern tanker ship auxiliary boiler in the process of offloading fuel at berth. See Miller, W. et al., “Emissions Evaluation of a Large Capacity Auxiliary Boiler on a Modern Tanker,” Draft Final Report, March 2020 (attached at Tab 6) (“CE-CERT Report”). CE-CERT conducted testing of the boiler in October 2019. The draft report, which is dated March 2020, was only made available to WSPA in early July 2020.

In our February 2019 comment letter on the Proposed Regulation, we expressed concern that the emission factors being used for tanker vessels “do not provide an accurate characterization of the emissions resultant from engines and boilers aboard a modern fleet” and specifically that the “stagnant PM emission factor is of particular concern.” Staff was and still is using a 0.151 g/kWh PM2.5 emission factor and a 1.995 g/kWh NOx emission factor for tanker boilers in its emissions inventory for the Proposed Regulation. These emission factors are based on a 2002 report from Entec compiling data on vessels that were over 20 years old at that time, few of which are still in operation today.<sup>5</sup> Critically, Entec’s boiler emissions factors were derived from boilers using heavy No. 6 fuel oil – *not* the cleaner burning, low sulfur distillate fuels CARB has mandated since 2008. See Entec Report, Ch. 2, p. 16 (“Emission factor measurement data relating to gas turbines and steam turbines are scarce in comparison to diesel engines and thus a greater uncertainty is associated with these factors. For steam turbines, all recent marine emission inventory studies have relied on US data from the early 1980s (US EPA, 1985 and Scott Environmental Technology Inc., 1981). Since no new data has been found in the literature and steam engines are in general being phased out, the same emission factors are proposed here.”) The old NOx and PM2.5 emissions factors for heavy fuel oil are significantly higher than those for the low sulfur distillate fuels burned in tankers today.

Based on empirical observation, the CE-CERT Report observed tanker boiler PM2.5 emissions of 0.022 g/kg-fuel, which (using Staff’s specific fuel consumption figure) converts to a PM2.5 emission factor of 0.0066 g/kWh.<sup>6</sup> ***This empirically-derived emission factor is 96% lower than the tanker PM2.5 emission factor still being used in Staff’s assumptions.***

While it appears results on metals emissions still have yet to be added to the report due to COVID-19 related delays, its PM and NOx data appear to be complete and are directly relevant to the proposed regulation of tanker terminals in this rulemaking. Not only were the CE-CERT Report’s

<sup>5</sup> See “Quantification of emissions from ships associated with ship movements between ports in the European Community,” Entec UK Limited, Final Report (July 2002), Ch. 2 (“Entec Report”) (available at [https://ec.europa.eu/environment/air/pdf/chapter2\\_ship\\_emissions.pdf](https://ec.europa.eu/environment/air/pdf/chapter2_ship_emissions.pdf)).

<sup>6</sup> The emissions factors derived here from the CE-CERT Report were derived using the same approach as the emissions factors calculated by Starcrest for CARB, in order to ensure the numbers cited herein can be meaningfully compared with the numbers used by CARB Staff.

15-5

conclusions based on empirical data from an actual in-service tanker vessel, they also are significantly instructive as to the broader tanker fleet calling at California ports and terminals. PM2.5 emissions from modern boilers are far less than those reflected in Staff's outdated PM2.5 emission factor largely due to changes in the type of fuel used and significant improvements to tanker boiler designs over 40 years. WSPA understands that CE-CERT discussed these findings with a representative from the boiler manufacturer (Alpha Laval) and was told that the improved nozzle designs used in current marine auxiliary boilers and the use of distillate fuel markedly reduced PM2.5 emissions due to less fouling and finer droplets.

If the CE-CERT Report's empirically derived emission factor were used in Staff's emissions estimates for tankers, the projected share of statewide ocean-going vessel ("OGV") PM2.5 emissions attributable to tanker vessels would fall from 50% to 20%. Yet at the June 25 Board hearing, Staff's slide presentation continued to misrepresent tankers' share of overall OGV PM2.5 emissions as 50%. At the June 25 hearing, Staff repeatedly cited this 50% number as an important basis for not adjusting compliance timelines or other requirements in the Proposed Regulation for tanker vessels.

Similarly, the CE-CERT Report observed real-world tanker boiler NOx emissions to be 0.858 g/kWh, which is 57% smaller than the obsolete 1.995 g/kWh factor used by CARB that is based on the 40-year-old study. As with PM2.5, CARB is greatly overestimating the NOx emissions associated with tankers, and thus inflating the associated health benefits. The table below summarizes the differences in the emissions factors measured by the CE-CERT and those used by CARB.

Source	NOx (g/kWh)	PM2.5 (g/kWh)
CE-CERT	0.858	0.0066
CARB	1.995	0.151
Staff Emissions Overstated By	233%	2,288%

The CE-CERT Report establishes that Staff's NOx and PM2.5 assumptions incorrectly overstate actual tanker auxiliary boiler emissions, overstating actual NOx by 233% and overstating actual PM2.5 by a whopping **2,288%**. Thus, the results of the CE-CERT Report must be assessed and incorporated into this rulemaking, and Staff's grossly overestimated PM2.5 and NOx emission factors must be corrected.

Also, the CE-CERT Report leads to potential questions about the validity of other Staff assumptions regarding tanker emissions and the resulting projections of health impacts. Together with refining its estimates of future economic and vessel activity as discussed above, Staff must incorporate these new emissions assumptions (and any other corrected emissions assumptions) into their overall analysis of anticipated future emissions levels, cost effectiveness calculations, and other variables dependent on the tanker emissions estimates.

Regardless of what conclusions are to be drawn from the Report, Staff has a legal duty to disclose and discuss the Report's findings. If Staff believe it is necessary to await a final version of the Report or solicit additional vessel testing before addressing the new emission data in this rulemaking, Staff should delay finalizing the Proposed Regulation.

15-5  
(con't)

\* \* \*

WSPA stands ready and willing to assist Staff in doing the hard work necessary to complete a feasibility study, so that we may determine whether at-berth capture and control for tankers can be accomplished safely and in accord with the newest international tanker standards. ***But if this work is not properly completed, lives will be put at risk.*** We remain deeply concerned that Staff have now submitted two revisions of the Proposed Regulation without adequate consideration of the significant health and safety issues posed, and without building in the time necessary for a feasibility study for tankers. This study must be done before imposing compliance mandates on ports and terminals, not years later. In the meantime, Staff cannot pretend that an unprecedented worldwide pandemic will have *no* impact on future economic activity or emissions. Staff must take the time needed to assess the serious economic impacts of COVID-19 and what it will mean in terms of true future emissions from OGVs. Stakeholders and the public deserve to have this rulemaking informed by a full and fair evaluation of the facts as they stand today, not as Staff might have understood them a year ago.

Sincerely,

A handwritten signature in blue ink, reading "Catherine A. Boyd", is positioned above a thin horizontal line.

#### British Library Cataloguing in Publication Data

A catalogue record for this book is available from the British Library.

The International Chamber of Shipping (ICS) is the principal international trade association for the shipping industry, representing shipowners and operators in all sectors and trades.

ICS membership comprises national shipowners' associations in Asia, Europe and the Americas whose member shipping companies operate over 80% of the world's merchant tonnage.

Established in 1921, ICS is concerned with all technical, legal, employment affairs and policy issues that may affect international shipping. It represents shipowners with the various intergovernmental regulatory bodies that impact on shipping, including the International Maritime Organization (IMO).

ICS also develops best practices and guidance, including a wide range of publications and free resources that are used by ship operators globally.

Founded in 1970, the Oil Companies International Marine Forum (OCIMF) is a voluntary association of oil companies having an interest in the shipment and terminalling of crude oil, oil products, petrochemicals and gas, and includes companies engaged in offshore marine operations supporting oil and gas exploration, development and production.

Our vision is a global marine industry that causes no harm to people or the environment.

Our mission is to lead the global marine industry in the promotion of safe and environmentally responsible transportation of crude oil, oil products, petrochemicals and gas, and to drive the same values in the management of related offshore marine operations. We do this by developing best practices in the design, construction and safe operation of tankers, barges and offshore vessels and their interfaces with terminals and considering human factors in everything we do.

Founded in 1955, the International Association of Ports and Harbors (IAPH) is a non-profit-making global alliance of 170 ports and 140 port-related organisations covering 90 countries. Its member ports handle more than 60 percent of global maritime trade and around 80 percent of world container traffic. IAPH has consultative NGO status with several United Nations agencies. In 2018, IAPH established the World Ports Sustainability Program (WPSP). Guided by the 17 UN Sustainable Development Goals, it aims to unite sustainability efforts of ports worldwide, encouraging international cooperation between all partners involved in the maritime supply chain. WPSP ([sustainableworldports.org](http://sustainableworldports.org)) covers five main areas of collaboration: energy transition, resilient infrastructure, safety and security, community outreach and governance.

#### Notice of Terms of Use

While the information and advice given in this guide (ISGOTT International Safety Guide for Oil Tankers and Terminals) has been developed using the best information currently available, it is intended purely as guidance to be used at the user's own risk. No warranties or representations are given nor is any duty of care or responsibility accepted by the International Chamber of Shipping (ICS), the Oil Companies International Marine Forum (OCIMF), the International Association of Ports and Harbors (IAPH), the members or employees of ICS, OCIMF, IAPH or by any person, firm, company or organisation who or which has been in any way concerned with the furnishing of information or data, the compilation or any translation, publishing, supply or sale of the guide, for the accuracy of any information or advice in the guide or any omission from the guide or for any consequence whatsoever resulting directly or indirectly from compliance with, adoption of, or reliance on guidance contained in the guide even if caused by failure to exercise reasonable care.

## Foreword

I am very pleased to introduce the revised Sixth Edition of the *International Safety Guide for Oil Tankers and Terminals*, or *ISGOTT* as it is generally known throughout the global tanker industry and amongst the Member States of the UN International Maritime Organization (IMO).

*ISGOTT*, first published in 1978, is now widely recognised as the definitive best practice guidance on tanker safety and pollution prevention, and is a perfect example of the good cooperation that exists between the IMO and the shipping industry the Organization regulates. The authors of this major publication – the International Chamber of Shipping (ICS), the Oil Companies International Marine Forum (OCIMF) and the International Association of Ports and Harbors (IAPH) – all enjoy consultative status with the IMO and contribute significantly to its work through their active participation at IMO meetings.

I believe that a reason why *ISGOTT* has endured, and is so highly regarded, is the vital complementary role it plays in working alongside the comprehensive framework of global shipping regulation that has been adopted by the IMO to help ensure safe and pollution-free ship operations.

Global maritime regulations, enforced by Flag States, are vital for ensuring that all ships, regardless of flag, can operate safely and efficiently wherever in the world they are trading. However, further detailed guidance on best operational practice is leveraged from the vast experience of industry professionals. Industry publications such as *ISGOTT* are therefore crucial for ensuring that the aims and objectives of IMO instruments, such as the MARPOL and SOLAS Conventions, are achieved in real life.

The safety record and the environmental performance of the tanker industry has improved substantially since the adoption by the IMO of its many Conventions and Codes. This impressive improvement in performance has not been delivered by regulation alone. It is a testimony to the good practices deployed, and constantly refined, by the industry itself and the dedication and huge professionalism of the seafarers and other personnel it employs.

This firm commitment by the industry to continuous improvement is a concept fully embraced by the IMO's ISM Code, and I believe this is clearly demonstrated by the industry's ongoing efforts to keep *ISGOTT* updated.

I fully support the industry-wide collaboration that has made this new edition of *ISGOTT* possible. This is crucial to ensuring that the maritime industry will not only contribute to maintaining and further improving its excellent safety record and reducing its environmental impact, but will also bring us ever closer to the ultimate goal of zero accidents.

**Kitack Lim**  
Secretary-General  
International Maritime Organization

## Introduction to the Sixth Edition

Effective management of health, safety and environmental protection is critical to the tanker and terminal industry and the *International Safety Guide for Oil Tankers and Terminals (ISGOTT)* has become the standard reference on the safe operation of oil tankers and the terminals they serve.

*ISGOTT* was first published in 1978 by combining the contents of the *Tanker Safety Guide (Petroleum)* published by the International Chamber of Shipping (ICS) and the *International Oil Tanker and Terminal Safety Guide* published on behalf of the Oil Companies International Marine Forum (OCIMF). This revision of *ISGOTT* updates and replaces the prior Fifth Edition that was published in 2006 and has been reviewed by OCIMF and ICS together with the International Association of Ports and Harbors (IAPH). In addition, support has also been provided by other industry associations including the International Association of Independent Tanker Owners (INTERTANKO), the Society of International Gas Tanker and Terminal Operators (SIGTTO) and the Society for Gas as a Marine Fuel (SGMF), as well as specialists in topics such as human factors.

Through the combined effort of multidisciplinary subject matter experts from these industry leading organisations, this publication has been enhanced to ensure that it continues to reflect current best practice and legislation and, as a result, will maintain its position as a definitive reference for the safe operation of oil tankers and the marine terminals they visit.

This Sixth Edition encompasses the latest thinking on a range of topical issues including gas detection, the toxicity and the toxic effects of petroleum products (including benzene and hydrogen sulphide), the generation of static electricity and stray currents, fire protection and the growing use of mobile electronic technology.

In addition, the opportunity was taken to include new topics or to significantly reappraise topics previously covered that have undergone a shift in emphasis since the Fifth Edition. These include:

- Enclosed space entry.
- Human factors.
- Safety Management Systems (SMSs), including complementary tools and processes such as permits to work, risk assessment, Lock-out/Tag-out (LO/TO), Stop Work Authority (SWA) and their linkage to the underlying principles of the *International Safety Management (ISM) Code*.
- Marine terminal administration and the critical importance of the tanker/terminal interface.
- Alternative and emerging technologies.
- Bunkering operations, including the use of alternative fuels such as Liquefied Natural Gas (LNG).
- Cargo inspectors.
- Alignment with OCIMF's recently revised *Mooring Equipment Guidelines*.
- Maritime security and linkage to both the *International Ship and Port Facility Security (ISPS) Code* and industry's maritime security *Best Management Practices (BMP)*.

The Ship/Shore Safety and Bunkering Operations Checklists have also been completely revised to reflect changes in the understanding of the impact of human factors in their effective use. The importance of ensuring that individual and joint responsibilities for the tanker and the terminal are clearly communicated before arrival, as well as when alongside, is central to this objective.

The Sixth Edition of *ISGOTT* retains the four section format of:

Part 1 General Information

Part 2 Tanker Information

Part 3 Marine Terminal Information

Part 4 Ship/Shore (Tanker/Terminal) Interface

Care has been taken to ensure that where the guidance given in previous editions is still relevant and accurate, any amendments, changes or deletions have only enhanced the content and not diminished the ethos of ensuring the health, safety and environmental protection of those who use the guide.

The authors believe that *ISGOTT Sixth Edition* continues to provide the best technical guidance on oil tanker and terminal operations. All operators are urged to ensure that the recommendations in this guide are not only read and fully understood, but are also followed through their SMSs and procedures.

## Purpose and Scope

The primary purpose of the *International Safety Guide for Oil Tankers and Terminals (ISGOTT)* is to provide operational advice to assist personnel directly involved in tanker and terminal operations. It makes recommendations for tanker and terminal personnel on the safe carriage and handling of crude oil and petroleum products on tankers and at terminals. It does not, however, provide a definitive description of how tanker and terminal operations are conducted.

To achieve its purpose *ISGOTT* provides guidance on, and examples of, certain aspects of tanker and terminal operations and how they may be managed. Effective management of risk demands SMSs, processes and controls and procedures that can quickly adapt to change. Therefore, the guidance given is, in many cases, intentionally non-prescriptive and alternative procedures may be adopted by operators in the management of their operations. These alternative procedures may exceed the recommendations contained in this guide and are strongly encouraged where they will further enhance the safety objective.

When adopting alternative procedures, operators should follow a risk-based management process that incorporates systems for identifying and assessing the risks and for demonstrating how they are safely managed. Guidance in the Sixth Edition is aimed at further assisting operators of tankers and marine terminals in these principles of safe management. For shipboard operations, this course of action must satisfy the requirements of the ISM Code.

In all cases, the advice given in *ISGOTT* is subject to any international, national or local regulations that may be applicable and is intended only to complement or strengthen those requirements. Companies responsible for the operation of tankers and terminals should ensure that they are aware of any such requirements and ensure full compliance.

It is recommended that a copy of *ISGOTT* is kept and used on board every tanker and in every marine terminal to provide advice on operational procedures and the shared responsibility for operations at the ship/shore interface.

Certain subjects are dealt with in greater detail in other publications issued by the IMO, ICS or OCIMF or by other maritime industry organisations. Where this is the case, an appropriate reference is made and a list of these publications is given in the bibliography.

It is not the purpose of the guide to make recommendations on design or construction of tankers. Information on these matters may be obtained from national authorities and from authorised bodies such as Classification Societies. Similarly, the guide does not attempt to deal with certain other safety related matters, e.g. navigation, helicopter operations and shipyard safety, although some aspects are inevitably touched upon.

It should also be noted that the scope of *ISGOTT* relates only to cargoes of crude oil and petroleum products that are carried in oil tankers, chemical tankers, gas carriers and combination carriers certified for the carriage of petroleum products. Therefore, it does not cover the carriage of chemicals or liquefied gases other than in the context of where they may be used on board oil tankers, e.g. LNG as a marine fuel. The carriage of chemicals and gases as cargo are the subject of other industry guides.

Industry guidance such as *ISGOTT* is based on the best knowledge and information available to the authors. Irrespective of this and the subject matter, or how strong and important the information provided, the industry is not in a position to mandate its own advice. For this reason, industry guidance in *ISGOTT* is characterised by the word 'should'. IMO regulations implemented by national administrations are legally enforceable and, therefore, when *ISGOTT* references such regulations or their implications the term used is 'must'.

Finally, the guide is not intended to encompass offshore facilities such as Floating Production Storage and Offloading Units (FPSOs) and Floating Storage Units (FSUs); operators of such units may, however, wish to consider the guidance given to the extent that good tanker practice is equally applicable to their operations.

Comments and suggestions for improvement are always welcome for possible inclusion in future editions. They may be addressed to any of the three sponsoring organisations as follows:

## CHAPTER 8

# Alternative and Emerging Technologies

- 8.1 Definition
- 8.2 Examples
- 8.3 Due diligence process

This chapter describes how alternative and emerging technologies can be assessed to make sure they do not affect safety on tankers and terminals. The due diligence process can be used in the tanker's SMS and safety manuals on the terminal. For more detail on alternative and emerging mooring technologies, see OCIMF's *Mooring Equipment Guidelines*.

---

### 8.1 Definition

Alternative technologies are technologies that have a documented track record in another sector but are not yet adopted in the tanker and terminal sector.

Emerging technologies are technologies that do not have a documented track record in any sector but could be developed in the future to improve the safety and the efficiency of the tanker and terminal sector.

In both cases, no known best practice would exist for the tanker and terminal sectors.

### 8.2 Examples

At the time of publication, the following alternative or emerging technologies exist:

- Marine Autonomous Surface Ships (MASS).
- Autonomous Underwater Vehicles (AUV).
- Marine mobile technology, e.g. intrinsically safe electronic tablets and telephones.
- Aerial drones.
- Robotic crawlers.
- Cold ironing.
- Methanol bunkering.
- Hydrogen fuel cell management.
- Electric cell propulsion power supply.

The list is not exhaustive. This guide does not endorse or oppose the listed technologies, but they may be considered for use following a structured due diligence and formal risk assessment process.

## 8.3 Due diligence process

### 8.3.1 Evaluation

Before considering the adoption of an alternative or emerging technology, a preliminary design review should be completed to evaluate the:

- General description and its equivalency to existing technologies.
- Functional description and its equivalency to existing technologies.
- Interface with existing technologies.
- Interface with existing systems and operational processes.
- Preliminary documentation, design drawings, general arrangements, product specifications and applicable codes and standards.
- Detailed formal safety and operational risk assessment plans, including assessments of human factors.
- Any additional design basis documentation.
- Consistency with other industry reference materials, e.g. the World Association for Waterborne Transport Infrastructure (PIANC) or the International Association of Classification Societies (IACS).

### 8.3.2 Impact

The tanker and terminal should complete an impact assessment before agreeing to use an alternative or emerging technology at the marine interface. This process should be documented and ensure that both parties have assessed and understood the risks of using the alternative or emerging technology.

If either the tanker or terminal is unable to complete the impact assessment, they should tell the other party what technology is being used and share any relevant documentation to support its use, e.g. the risk assessment and evaluation reports of design and product specifications.

If the alternative or emerging technology only affects the tanker or the terminal, the above exchange does not need to happen unless a general understanding would be useful.

### 8.3.3 Equivalency

Equivalency should be demonstrated through detailed data analysis of engineering or design studies, prototype and/or on-site testing and experience. Compare the data analysis of the alternative or emerging technology with the existing technology it is replacing or being used alongside.

Equivalency should show that the alternative or emerging technology is at least as good as the existing technology in delivering:

- The safety of tanker and terminal personnel.
- The assurance that the risks continue to be effectively managed.
- Suitable margins of safety that include the probability and consequence of system failure.
- Operational effectiveness and integrity.
- Compliance with applicable regulations, standards and recommended industry guidance and best practices.

### 8.3.4 Formal safety risk assessments

Formal, documented and detailed safety risk assessments should be carried out to understand the risks of using alternative or emerging technologies. It is recommended that personnel conducting these risk assessments:

- Are experienced in the methods of risk assessment being used.
- Have a detailed working knowledge of the alternative or emerging technology, the equivalent existing technology and industry best practices.

Classification Societies, marine consultants or other organisations may provide an independent formal safety risk assessment or guidance on how to effectively evaluate alternative and emerging technologies.

The IMO also provides guidance to administrations for approving alternatives and equivalents in MSC.1/Circ.1455 *Guidelines for the Approval of Alternatives and Equivalents as Provided for in Various IMO Instruments*.

Factors to consider in a formal safety risk assessment of an alternative or emerging technology include:

- Hazards associated with the alternative or emerging technology and/or its equivalency.
- Safeguards incorporated into the design of the alternative or emerging technology, including measures to ensure the safety of personnel.
- Human factors and any risk reducing benefits from adopting the alternative or emerging technology.
- Risk modelling to identify frequencies and potential consequences of hazards.
- Risks related to the local conditions and locally required operations.
- Issues that may require further detailed analysis and testing/evaluation.
- Issues that may require special attention with respect to operations, inspection and maintenance, including personnel, equipment and systems redundancy.
- How the alternative or emerging technology works under different environmental conditions, e.g. air temperature, marine spray or ice.

### 8.3.5 Stakeholder engagement

The number and type of stakeholders involved in evaluating an alternative or emerging technology will depend on its impact and the complexity of its implementation.

Stakeholder mapping is recommended for identifying stakeholders who are important to the evaluation and success of the alternative or emerging technologies.

## Foreword

The marine and offshore industries regularly develop new technologies that have no service history in the proposed application or environment. Often, governing industry codes and regulations do not develop at the same pace as technology. These new technologies have little or no precedent and may be so different from existing designs that the requirements contained in class Rules may not be directly applicable.

These Guidance Notes describe the ABS approach for qualification of new technologies to confirm their ability to perform intended functions in accordance with defined performance requirements. This document also provides details regarding the required submittals and the key interaction points with ABS during the new technology development to benefit from ABS involvement as a trusted advisor.

A systems engineering approach to qualification is introduced in this document that allows for systematic and consistent evaluation of new technologies as they mature from a concept through confirmation of operational integrity in their intended applications. The approach is divided into a five stage process that is aligned with the typical product development phases of a new technology:

- Feasibility Stage
- Concept Verification Stage
- Prototype Validation Stage
- System Integration Stage
- Operational Stage

Completion of qualification activities within each stage of the new technology qualification process results in a Statement of Maturity issued to the client attesting to the maturity level of the new technology. Upon completion of the Prototype Validation Stage, the new technology may be “Type Approved” under the ABS Type Approval Program to limit repeated evaluation of identical designs for eligible products. During the Prototype Validation Stage, if all the engineering evaluations have been completed, a Product Design Assessment (PDA) can be issued prior to further consideration for ABS Type Approval.

The integration of the new technology qualification process with the Novel Concept Class Approval process (as presented within the *ABS Guidance Notes on Review and Approval of Novel Concepts*) provides end users of the qualified technologies with the added benefit that the transition from new technology qualification to Class Approval will be seamless. It provides regulatory agencies with the confidence that all hazards associated with the introduction of the new technology to the market has been systematically identified and mitigated. It is to be noted that when applying these Guidance Notes for certification or classification purposes in conjunction with Novel Concept Class Approval process, the primary driver for classification acceptance will be safety even though there may be additional functional requirements (e.g., reliability) defined by the client.

These Guidance Notes become effective on the first day of the month of publication.

Users are advised to check periodically on the ABS website [www.eagle.org](http://www.eagle.org) to verify that this version of these Guidance Notes is the most current.

*We welcome your feedback. Comments or suggestions can be sent electronically by email to [rsd@eagle.org](mailto:rsd@eagle.org).*

## Terms of Use

## SECTION 1 Introduction

### 1 Overview

These Guidance Notes describe the ABS approach for qualification of new technologies to confirm their ability to perform intended functions in accordance with defined performance requirements. They also provide details of the required submittals, the ABS review process and the key interaction points with ABS during the new technology development.

This document introduces a systems engineering approach to qualification that allows for systematic and consistent evaluation of new technologies as it matures from a concept through confirmation of operational integrity in its intended application. The approach is divided into a multi-stage process that is aligned with the typical product development phases of a new technology. The qualification activities within each stage employ risk assessments and engineering evaluations that build upon each other in order to determine if the new technology provides acceptable levels of safety in line with current offshore and marine industry practice. The qualification efforts by all stakeholders including the vendor, system integrator and end-user at each stage are recognized and captured within a new technology qualification plan (NTQP). Completion of qualification activities as identified within each stage of the NTQP results in a Statement of Maturity being issued by ABS attesting to the maturity level of the new technology.

The process is also compatible with approaches based on technology readiness levels (TRLs), (e.g. API RP 17N/Q, ISO 16290/NASA, and US DoD); and can be tailored to projects that require the use of multiple pathways to qualification. The comparison of ABS Qualification Stages with industry TRLs can be found in Appendix 2.

It is to be noted that when applying these Guidance Notes for certification or classification purposes in conjunction with Novel Concept Class Approval process, the primary driver for classification acceptance will be safety even though there may be additional functional requirements (e.g., reliability) defined by the client.

### 3 Background

The marine and offshore industries regularly develop new technologies that have no service history in the proposed application or environment. Often, governing industry codes and regulations do not develop at the same pace. These new technologies have little or no precedent and may be so different from existing designs that the requirements contained in class Rules may not be directly applicable.

Marine vessels and offshore units which contain new technological features or designs that are not currently governed by Rules, Guides and existing industry standards may still be qualified and/or approved by ABS through the process described in these Guidance Notes. This qualification is on the basis that the Rules, Guides, and existing industry standards, insofar as applicable, have been complied with, and that special consideration through appropriate risk assessments and engineering evaluations has been given to the new features through the application of these Guidance Notes.

These Guidance Notes are structured to provide a general procedure for vendors/system integrators/end-users to guide them through the process of obtaining Statements of Maturity attesting to the maturity level of new technologies. The process can be applied to technologies seeking qualification independent of class approval or installation on ABS classed assets.

The integration of the new technology qualification process and the Novel Concept Class Approval process provides end users of the qualified technologies with the added benefit that the transition from new technology qualification to Class Approval will be seamless. It provides regulatory agencies with the confidence that hazards associated with the introduction of the new technology has been systematically identified and mitigated.

## 5 Application

These Guidance Notes are in general applicable to all new technologies for offshore units and marine vessels that do not follow typical Rules, Guides, or industry codes or standards. This document provides guidance to parties seeking recognition for the maturity level of a proposed new technology.

A new technology for the purpose of these Guidance Notes is defined as any design (material, component, equipment or system), process or procedure which does not have prior in-service experience, and/or any classification rules, statutory regulations or industry standards that are directly applicable. It is possible to categorize the type of “novelty” in one of four categories:

- i) Existing design/process/procedures challenging the present boundaries/envelope of current offshore or marine applications
- ii) Existing design/process/procedures in new or novel applications
- iii) New or novel design/process/procedures in existing applications.
- iv) New or novel design/process/procedures in new or novel applications

An asset such as a marine vessel or an offshore unit becomes a novel concept if the incorporation of any new technology(ies) appreciably alters its service scope, functional capability, and/or risk profile. Novel concepts are typically presented to ABS for review and class approval following the process in the *ABS Guidance Notes on Review and Approval of Novel Concepts (Novel Concept Guidance Notes)*.

The New Technology Qualification (NTQ) process could be applicable in the following cases:

- i) To qualify new technology that may need to be classed or certified at a later date
- ii) To simultaneously qualify new technology identified while seeking class approval for a novel concept
- iii) To qualify a new technology independent of the need to be classed or certified

If the proposed new technology is intended for incorporation on an asset to be classed by ABS, then it is recommended that the new technology complete up to and including the System Integration Stage of the New Technology Qualification (NTQ) process. In other cases, the level of maturity to which the new technology may be qualified depends on the client’s request. New technology qualification could be requested from ABS at any level of indenture as desired such as component, sub-system or system level.

The process is designed to accommodate cases where multiple vendors, system integrators, and/or end-users need to work together to qualify a combination of new technologies. In such cases, it is important for the teams to work together to integrate technologies as early as possible in order to optimize the process. Even though these Guidance Notes are primarily intended for the qualification of new technologies, the approach could also be applied to qualify existing technologies.

## 7 New Technology Qualification Process

The NTQ process confirms the ability of a new technology to perform its intended functions in accordance with defined performance requirements. The process starts with a comprehensive description of the technology to be qualified, followed by a screening of the technology to reveal the new or novel features that the qualification should focus on.

The process is divided into five sequential stages that progressively qualify the technology from feasible to operational stages as requested. The five qualification stages are:

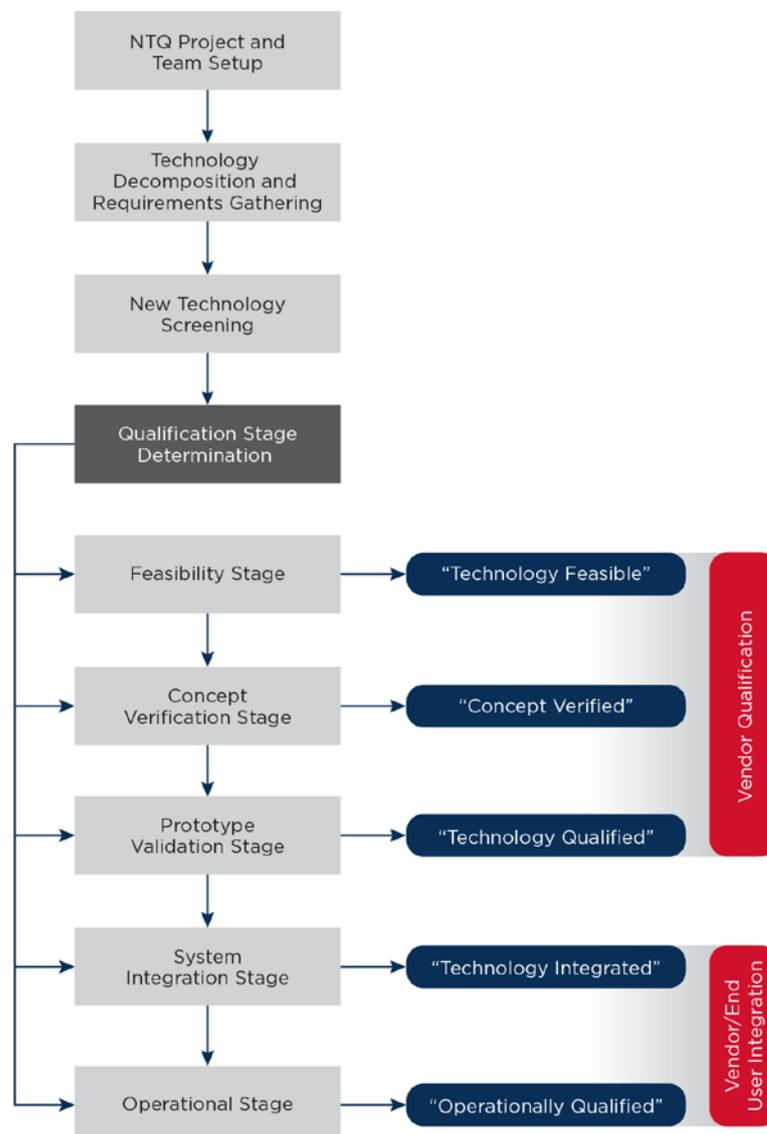

- i) Feasibility Stage
- ii) Concept Verification Stage
- iii) Prototype Validation Stage
- iv) System Integration Stage
- v) Operational Stage

Qualification activities outlined in the New Technology Qualification Plan (NTQP), are to be performed within each stage and should be defined at the end of the previous stage as agreed between the client and ABS. The qualification activities are based on the information available depending on the maturity level and based on the findings and knowledge gained in the previous stages completed. Typically, there are two main sets of activities within each stage, namely, engineering evaluations and risk assessments.

Upon completion of each of the five stages, a Statement of Maturity will be issued to the vendor(s) and the technology can progress to the next stage of maturity. It is envisioned that some vendors may have developed technologies to a level beyond the Feasibility Stage prior to contacting ABS for this qualification service. In such cases, ABS would perform an assessment of the current stage of technology development and endorse the technology with the applicable Statement of Maturity based on this assessment. The technology qualification can then proceed starting at that stage and continuing to the subsequent stages. Additionally, the new technology qualification process can be stopped at any stage, and restarted at an agreed upon time.

Section 1, Figure 1 provides a basic overview of the process along with the Statements of Maturity issued. Further guidance on each topic and deliverables that are to be submitted to ABS for review can be found in later Sections.

**FIGURE 1**  
**New Technology Qualification Process**

## 9 ABS Type Approval Program

New technologies that have completed the Prototype Validation Stage of the NTQ process or have been “Technology Qualified”, and can be consistently manufactured to the same design and specification may be “Type Approved” under the ABS Type Approval Program. During the Prototype Validation Stage, if all the engineering evaluations have been completed, a Product Design Assessment (PDA) can be issued prior to further consideration for ABS Type Approval. The ABS Type Approval Program is a voluntary option for the demonstration of compliance of a system or product with the defined performance requirements as derived from Rules, Guides, or other recognized standards. It may be applied at the request of the vendor or manufacturer. The suitability of the ABS Type Approval Program for the proposed new technology will be determined on a case-by-case basis.

Specific requirements and details regarding the ABS Type Approval Program can be found in 1-1-4/7.7 and Appendix 1-1-A3 of the *ABS Rules for Conditions of Classification (Part 1)*.

## 11 Definitions

*As Low As Reasonably Practicable (ALARP)*. Refers to a level of risk that is neither negligibly low nor intolerably high, for which further investment of resources for risk reduction is not justifiable. Risk should be reduced to ALARP level considering the cost effectiveness of the risk control options.

*Approval*. Confirmation that the plans, reports or documents submitted to ABS have been reviewed for compliance with one or more of the required Rules, Guides, standards or other criteria acceptable to ABS.

*Availability*. Ability of an item to be in a state to perform a required function under given conditions at a given instant of time or over a given time interval, assuming that the required external resources are provided (ISO 14224).

*Boundary*. Interface between an item and its surroundings (ISO 14224).

*Client*. The vendor, OEM, manufacturer, asset owner/operator of the new technology or novel concept, representing any party or parties that have a stake or interest in the design or third party groups working under or for these entities.

*Consequence*. The measure of the outcome of an event occurrence in terms of people affected, property damaged, outage time, dollars lost or any other chosen parameter usually expressed in terms of consequence per event or consequence amount per unit of time, typically per year.

*Controls*. The measures taken to prevent hazards from causing undesirable events. Controls can be physical (e.g., safety shutdowns, redundant controls, added conservatism in design, etc.), procedural (e.g., operating procedures, routine inspection requirements, etc.) and can also address human factors (employee selection, training, supervision).

*Critical Assumption*. An assumption that if found not true will change the conclusions of the study that used such assumption.

*Engineering Evaluations*. Various engineering analysis tools and testing that may be used to support new technology qualification activities. Typical examples include but not limited to the following: Finite Element Analysis (FEA), Computational Fluid Dynamics (CFD), Functional and Performance Testing, Model Testing, System Integration Testing, etc.

*Failure*. The loss of the ability to perform the intended function.

*Failure Causes*. Circumstances associated with design, manufacture, installation, use and maintenance that have led to a failure (ISO 14224).

*Failure Mechanism*. A physical or chemical process resulting in a form of damage which will ultimately lead to failure.

*Failure Mode*. The specific manner of failure that the failure mechanism produces.

*Functional Specification*. Document that describes the features, characteristics, process conditions, boundaries and exclusions defining the performance and use requirements of the product, process or service (ISO 13880).

- Frequency.* The occurrence of a potential event per unit of time, typically expressed as events per year.
- Global Effects.* Total effect an identified failure has on the operation, function or status of the installation or vessel and end effects on safety and the environment.
- Hazards.* Conditions that exist which may potentially lead to an undesirable event.
- Indenture Level.* The level of subdivision of an item from the point of view of maintenance action (ISO 14224).
- Item.* Any part, component, device, subsystem, functional unit, equipment or system that can be individually considered (ISO 14224).
- Local Effects.* Impacts that an identified failure mode has on the operation or function of the item under consideration or adjacent systems.
- Maintainability.* Ability of an item under given conditions of use, to be retained in, or restored to, a state in which it can perform a required function, when maintenance is performed under given conditions and using stated procedures and resources (ISO 14224).
- Manufacturing Assessment (MA).* An inspection of the product during manufacture, an assessment of the quality control system and manufacturing processes that must be satisfactorily completed if the manufacturer wants a product to be labeled “Type Approved” under the ABS Type Approval Program.
- Manufacturing Plan.* Document setting out the specific manufacturing practices, technical resources and sequences of activities relevant to the production of a particular product including any specified acceptance criteria at each stage (ISO 13880).
- Product Design Assessment (PDA).* Technical evaluation of a product for potential use on ABS-classed assets. The process involves ABS Engineers verifying product compliance with manufacturers’ specifications, applicable ABS Rules and national or international standards.
- Quality Assurance and Quality Control.* Typical quality plans and related processes for controlling quality during production.
- Qualification.* The process of confirming, by examination and provision of evidence, that equipment meets specified requirements for the intended use (API RP 17N).
- Qualification Activities.* Usually in the form of risk assessments, engineering evaluations, and testing that is required to be performed in order to mature the new technology to the next stage.
- Qualification Plan.* A document containing the qualification activities listed to mature the new technology to the next qualification stage. This is submitted as a New Technology Qualification Plan (NTQP) report.
- Redundancy.* Existence of more than one means for performing a required function of an item (ISO 14224).
- Reliability.* Ability of an item to perform a required function under given conditions for a given time interval (ISO 14224).
- Risk.* The product of the frequency with which an event is anticipated to occur and the consequence of the event’s outcome.
- Risk Profile.* Description of any set of risks (ISO 31000).
- Technical Specification.* Document that defines technical requirements to be fulfilled by the product, process or service in order to comply with the functional specification (ISO 13880).
- Type Approval.* A voluntary ABS Program for product certification that is used to demonstrate a product manufacturer’s conformance to the Rules or other recognized standards. The Product Design Assessment (PDA) and Manufacturing Assessment (MA) together result in a Type Approval or a “Type Approved” product.
- Validation.* The process of evaluating a production unit (or full scale prototype) to determine whether it meets the expectations of the customer and other stakeholders as shown through performance of a test, analysis, inspection, or demonstration.
- Verification.* The process of evaluating a system to determine whether the product of a given development stage satisfy the approved requirements and can be performed at different stages in the product life cycle by test, analysis, demonstration, or inspection.

## SECTION 2 Getting Started

### 1 New Technology Qualification Project and Team Setup

Once the client (vendor/system integrator/end-user) requests qualification of a technology using these Guidance Notes, a project kick-off meeting is scheduled. At this meeting, the client presents to ABS a brief overview of their proposed technology along with their expectations, any ongoing qualification activities (if initiated) and project timelines. ABS will advise the client if new technology qualification is the most appropriate path for proceeding and recommend next steps.

The kick-off meeting is followed by the establishment of a new technology qualification team. An important factor for a successful technology qualification is the composition of the qualification team. The qualification process involves the interaction of two teams: the vendor or client team (design team) and the ABS-designated review team.

For each NTQ project, depending on the complexity of the proposed new technology, ABS may establish a special multidisciplinary review team comprised of ABS staff members. The composition of the team will depend on the technical areas involved in the project as well as the physical location of the client's engineering and testing facilities. This will help the client benefit from technical review and comment from our subject matter experts throughout the qualification process. One of the members will be the designated NTQ project lead to act as the client's main point of contact throughout the NTQ process. All ABS team members will be covered under the confidentiality/non-disclosure agreement that is typically signed between ABS and clients for this type of qualification services.

It is encouraged whenever possible to include ABS, system integrators and end users of the new technology early in the qualification process. This will facilitate the identification and alignment of requirements early in the design process avoiding costly design modifications later. If applicable, input from regulatory agencies (including flag Administration) will also help align the qualification activities with requirements or other expectations.

### 3 New Technology Decomposition and Requirements Gathering

#### 3.1 Introduction

The NTQ process follows a systems engineering approach to qualifying new technology. This approach focuses on the following elements:

- Defining goals of the new technology
- Identifying the functional requirements to meet the goals
- Identifying the performance requirements for the functional requirements
- Performing qualification activities to verify and validate the performance requirements

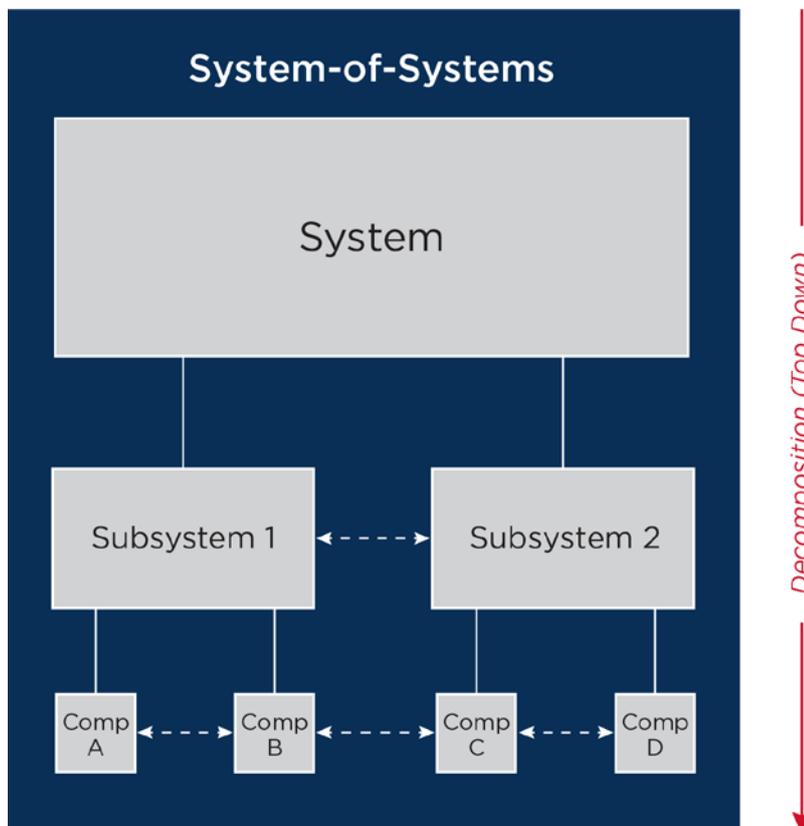

The qualification process starts with a top-down system decomposition, wherein the system is divided into subsystems, which are further broken down into components. This decomposition process is used in order to achieve the following:

- Mapping functional requirements of the system to item(s) (e.g., subsystems or components) identifying ownership of a specific functional requirement,
- Mapping functional requirements to specific performance requirements,
- Confirming that all defined functional requirements can be addressed by configurable items,
- Identifying new technology items prior to determining if qualification is needed and what interactions between items need to be considered.

Depending on the type of item for which the client is seeking qualification, the NTQ process can be tailored. This is applied by considering the different categories of new technology as defined in Subsection 1/5 and understanding what exactly has changed to focus qualification efforts.

The maximum maturity level of the system is based on the individual qualification of each item(s). For example, the overall maturity level of the system is equal or lower than that of the subsystems, which are equal or lower than that of the individual components. The decomposition, system hierarchy and interactions between all items are depicted in Section 2, Figure 1.

**FIGURE 1**  
**New Technology System Hierarchy**

The item for which new technology qualification is desired could be at any level of indenture within the system hierarchy. System-of-Systems (SoS) refers to the larger system with which integration of the new technology could occur. This SoS could be another system or an asset such as a marine vessel or an offshore unit. The asset becomes a novel concept if the incorporation of any new technology(ies) appreciably alters its service scope, functional capability, and/or risk profile.

### 3.3 New Technology System Requirements and Description Document

Properly defining a new technology is a critical aspect of NTQ. For this purpose, a system requirements and description document (SRDD) should be developed for the new technology and maintained throughout the NTQ process. This document defines and sets the baseline requirements for the new technology and may be derived from functional and technical specifications. The requirements will be defined for each level within the system hierarchy as applicable. As the design matures through development and more knowledge is gained through qualification, these requirements may be subject to change. The SRDD will need to be updated accordingly.

#### 3.3.1 Defining System Requirements

*3.3.1(a) Goals.* The goals defined for the new technology should identify the high-level scope, objectives, or requirements that the new technology needs to meet. Goals may be derived from client's needs, mission, measures of effectiveness, environmental or application constraints, program/policy decisions and/or requirements derived from tailored specifications or standards.

*3.3.1(b) Functional Requirements.* Functional requirements define each function that the system is required to perform. The functional requirements should be mapped to specific items that will perform the function and typically includes a description of the function to be performed, the environment within which the function should be performed, the conditions under which the system should start the function and the conditions under which the system should terminate the function.

*3.3.1(c) Performance Requirements.* The performance requirements define how well each functional requirement should be accomplished, and the set of performance metrics including identification of critical performance parameters. The performance requirements can be defined qualitatively at early design stages and progressively more quantitatively during subsequent stages of technology maturation. In case where performance requirements are not defined because of the novelty of the technology, the requirements should be extrapolated from existing Rules, Guides, and/or other industry standards. Any relevant requirements from regulatory agencies or Flag Administration should be also considered. The performance criteria is the acceptance criteria against which the results of each qualification activity is evaluated.

The requirements should be defined according to NATO AVT-092 "Qualification by Analysis" and/or ISO 13879 "Petroleum and natural gas industries – Content and drafting of a functional specification". The aspects to consider for inclusion while defining functional requirements and related performance requirements may vary depending on the new technology to be qualified but typical considerations include:

*3.3.1(d) Design Conditions.* The system design conditions describe all applicable loading requirements under the environmental and operating conditions. This should include, but not be limited to, the natural environment (e.g., temperature and chemical exposure), the induced environment (e.g., vibration and noise), electromagnetic signal environment, and threats. Typical loading and design conditions to be considered include, but are not limited to, the following:

- Pressure and temperature induced loads and fluctuations
- Static and dynamic loads
- Fatigue and fracture effects
- Wear and vibration effects
- Material degradation and associated loss from damage mechanisms
- Accidental loads (as applicable)

*3.3.1(e) System Interface Requirements.* The system interface requirements define all internal and external physical and functional interfaces (e.g., mechanical, electrical, etc.) relevant to the new technology. Interfaces among system elements should also include interfaces with the human element. The system interface definition confirms that various elements of the system can functionally and physically interact with each other and with all external systems they connect to or communicate with. A graphic description of the interfaces can be used when appropriate for clarity.

3.3.1(f) *Human System Integration Requirements.* Human factors play an important role for the system to work safely and effectively in achieving required functions and goals, and should be considered throughout the design life of the new technology. Human factors requirements (ergonomics) define the characteristics of human system interaction in terms of usability, safety, human reliability, performance, effectiveness, efficiency, maintainability, and health. It is important that human factors be considered during early design stages.

Human Factors Engineering (HFE) is a specialized engineering discipline that integrates human behavioral and physical capabilities and limitations with traditional engineering disciplines to produce a human-system interaction that maximizes the best of both, allowing both the human and system to work together in achieving functional and performance requirements.

The focus of HFE is the design of the human-system interface. This includes interfaces between personnel and the hardware, software, and physical environments associated with systems. It also involves the interfaces between personnel, individual tasks, and the overall work system (e.g., its structure, management, policies, and procedures). A good starting point is defining usability requirements which identify user needs and expectations. Usability requirements define the appropriate allocation of functions between users and the technology as well as the measurable effectiveness, efficiency, and satisfaction criteria in specific contexts of use.

During the design process, specific areas, stations, or equipment arrangement that would require concentrated human engineering attention should be defined. Any special requirements, such as constraints on allocation of functions to personnel and communications and personnel/equipment interactions, should be specified. Successful application of HFE depends on a proper process of conducting the appropriate activities in the various stages of the development lifecycle of the system.

Further guidance on Human Factors Engineering can be found in the following references:

- *ABS Guide for Ergonomic Notations*
- *ABS Guidance Notes on the Implementation of Human Factors Engineering into the Design of Offshore Installations*
- *ABS Guidance Notes on the Application of Ergonomics to Marine Systems*
- *ABS Guidance Notes on Ergonomic Design of Navigation Bridges*
- *Standard Human Engineering Program Requirements for Ships and Marine Systems, Equipment and Facilities, Standard 1337. American Society of Testing and Materials (ASTM) (2010)*
- *Common Requirements, Architectural Components & Equipment (C-CR-002). Norwegian Oil Industry Association and the Federation of Norwegian Engineering Industries (NORSOK). (1996)*
- *Working Environment (S-002). Norwegian Oil Industry Association and the Federation of Norwegian Engineering Industries (NORSOK). (2004)*

3.3.1(g) *Maintainability.* Specify the quantitative maintainability requirements that apply to maintenance in the planned maintenance and support environment. Examples are as follows (ISO 29148):

- Time (e.g., mean and maximum downtime, reaction time, turnaround time, mean and maximum times to repair, mean time between maintenance actions)
- Rate (e.g., maintenance staff hours per specific maintenance action, operational ready rate, maintenance time per operating hour, frequency of preventative maintenance)
- Maintenance complexity (e.g., number of people and skill levels, variety of support equipment, removing/replacing/repairing components)
- Maintenance action indices (e.g., maintenance costs per operating hour, staff hours per overhaul)
- Accessibility to components within systems and to parts within components

*3.3.1(h) Reliability.* Reliability describes the ability of a system or component to function under stated conditions for a specified period of time. Reliability requirements determine the robustness, consequences of, and redundancy of the system. Reliability requirements are best stated as quantitative probability statements that are measurable by test or analysis, such as the mean time between failures (MTBF) and the maximum acceptable probability of the failure during a given time period.

*3.3.1(i) Safety and Environment.* Safety and environmental requirements applicable to eliminating or minimizing hazards related to people, environment, and asset.

*3.3.1(j) System Life Cycle Sustainment.* The system life cycle sustainment requirements include activities that relate to sustaining the quality or integrity of the system. Typical requirements include, but are not limited to, support, sparring, sourcing and supply, provisioning, technical documentation, personnel support training for all modes of operation (e.g., installation, hook-up, commissioning, and decommissioning) throughout the life cycle of the system. These requirements should be updated as needed in order to sustain performance.

*3.3.1(k) Data Management and System Security.* For data-intensive systems, the management of information should be defined. The information management requirements should define the information the system receives, stores, generates and exports as well as the backup of the information.

System security requirements define both the surrounding environment (i.e., location) of the system and the operational security requirements. For example, to protect the system from accidental or malicious access, use, or destruction, some protection methods (e.g., access limitations, use of passwords, or the restriction of communications between some areas of the system) can be used. For control systems that govern multiple critical aspects of the assets, insights should be provided for operations, maintenance and support of cyber-enabled systems, to improve security in those systems.

The ABS CyberSafety™ program addresses cyber-enabled systems protection in an extended set of engineering processes that emphasizes human and systems safety. For further guidance on this program refer to the following documents:

- *ABS Guidance Notes on Application of Cybersecurity Principles to Marine and Offshore Operations – ABS CyberSafety™ Volume 1*
- *ABS Guide for Cybersecurity Implementation for the Marine and Offshore Operations – ABS CyberSafety™ Volume 2*
- *ABS Guidance Notes on Data Integrity for Marine and Offshore Operations – ABS CyberSafety™ Volume 3*
- *ABS Guide for Software Systems Verification – ABS CyberSafety™ Volume 4*
- *ABS Guidance Notes on Software Provider Conformity Program – ABS CyberSafety™ Volume 5*

### 3.3.2 System Description

The SRDD is also to include a detailed technology description. This involves additional documentation that could help provide evidence or demonstrate the ability of the technology to meet defined system requirements. The description of the technology typically includes the following:

- i)* Equipment list
- ii)* Comparison with existing similar technologies
- iii)* Lessons learned from similar technologies
- iv)* Possible applicable standards, codes, or industry practices

- v) Relevant engineering documents as applicable:
  - Piping and Instrumentation Diagrams (P&IDs)
  - Heat and material balances
  - Block diagrams
  - Design schematics
  - General arrangements
  - Material specifications including material properties
  - Design analysis methodology and related reports
  - Installation analysis
  - Test reports
- vi) Control and safety system details
- vii) Operational, maintenance, and inspection strategies
- viii) New or unproven manufacturing, assembly, transit, storage, installation, hook-up, testing, commissioning, and decommissioning details
- ix) Quality, health, safety, and environmental philosophies

The SRDD needs to be submitted for ABS review. The SRDD is not intended to be a single consolidated document but a design review package that compiles the relevant documents.

It is recognized that the requirements definition and the supporting description documentation is developed throughout the NTQ process. The submittal only needs to include the information available based on the design maturity of the new technology.

## 5 New Technology Screening

Once the technology has been described, a systematic screening process is needed in order to identify the new or novel elements, characteristics, or environment for which qualification is needed. The decomposed system should be reviewed to identify which of those items are considered new technology, as defined in Subsection 1/5, and which ones are not. The level of effort involved in qualification increases from categories *i*) through *iv*). Items that are not considered new technology could follow the conventional ABS certification process.

For new technology items, it is useful to identify whether similar technology exists and whether relevant Rules, Guides, and/or standards apply wholly or partially for this technology. Identifying the new technology items provides a basis for reducing the qualification scope to only those items that need to be addressed through the NTQ process. The vendors could perform the screening process independently or in a workshop setting with ABS, which will help support/guide the process. Section 2, Table 1 below, is a sample table that can be used for a systematic screening.

**TABLE 1**  
**Systematic Screening Table**

<i>Item</i>	<i>Description</i>	<i>Similar Technology Exists?</i>	<i>Relevant Rules, Guides, or Industry Standards for This or Similar Technology?</i>	<i>New Technology (Yes/No)</i>	<i>New Technology Category (i, ii, iii, iv)</i>	<i>Notes</i>
1		Technology 1, Technology 2...	Standard 1 (partially) Standard 2 (No)...	Yes	<i>i</i>	
2		No	Standard 1 (partially) Standard 2 (partially)...	Yes	<i>iii</i>	
3		This technology exists	N/A	No	N/A	

**Columns:**

*Description:* Description of elements of the new technology item(s) (e.g., subsystems)

*Similar Technology Exists?:* Identify whether similar technologies exist, for example, technologies in other industries (e.g., onshore, aerospace, etc.). If existing technology exists, list them in this column.

*Relevant Standards for This or Similar Technology:* List of any standards applicable to the new technology with short explanation about applicability.

*New Technology (Yes/No):* Decide which technologies are new and which are not.

*New Technology Category:* As defined in Subsection 1/5:

- i)* Existing technology challenging current boundary/envelope
- ii)* Existing technology in new applications
- iii)* New technology in existing applications
- iv)* New technology in new applications

*Notes:* Other information or justification relevant to the screening process (e.g., conditions for applicability of standards, recommendations for qualification, etc.).

The systematic screening results and supporting information is to be submitted for ABS review.

## 7 New Technology Stage Determination

Based on the results from the new technology screening process and review of the SRDD, ABS and the client will agree on a maturity level determination. An appropriate qualification stage will be assigned to proceed, with qualification activities. A detailed questionnaire for determining the technology maturity level and qualification stage can be found in Appendix 3.

A more mature design could result in the ability to start at a later qualification stage, thus minimizing the level of effort and time it takes to complete qualification of the new technology. Once credit has been given to the design maturity and the appropriate qualification stage is determined, the client can proceed through the qualification process outlined in the following Sections:

- Feasibility Stage (Section 3)
- Concept Verification Stage (Section 4)
- Prototype Validation Stage (Section 5)
- System Integration Stage (Section 6)
- Operational Stage (Section 7)

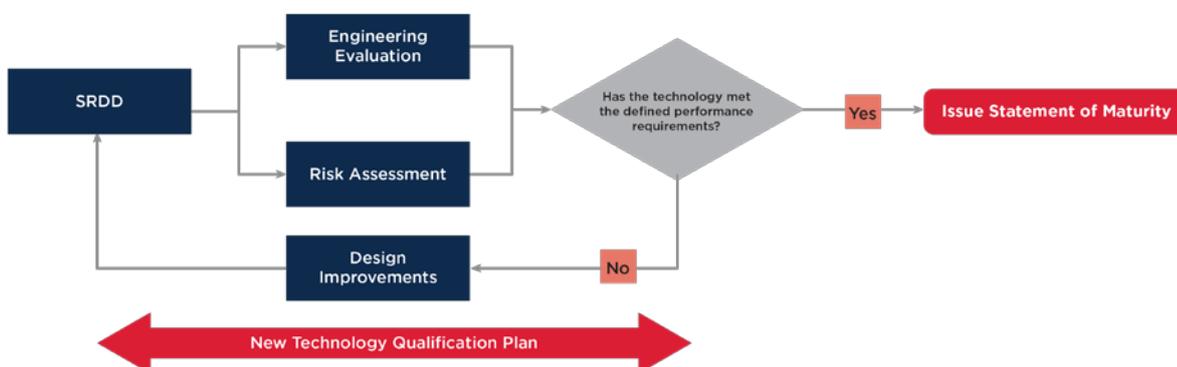

## 9 New Technology Qualification Plan and Activities

The New Technology Qualification Plan (NTQP) defines a roadmap for progressing the new technology through the appropriate qualification stages. The objective of the NTQP is to provide a summary of qualification activities that need to be performed at each stage in order to demonstrate the ability of the new technology to meet the requirements specified in the SRDD.

The initial NTQP should be developed based on the findings in the screening process in Subsection 2/5. The NTQP for each subsequent stage is updated based on the findings from the previous stage activities and discussions between the client and ABS. A NTQP template is provided in Appendix 4.

Qualification within each stage is comprised of a set of iterative activities that include engineering evaluations and risk assessments to verify new technology design. Results of these activities could lead to design improvements or modifications to the requirements specified in the SRDD. All design improvements and/or modifications should be documented in the NTQP with necessary technical justification. Section 2, Figure 2 summarizes the iterative NTQP activities.

**FIGURE 2**  
**New Technology Qualification Stage Iterative Process**

### 9.1 Risk Assessment Requirements

As stated in Subsection 2/9, a risk assessment is to be prepared and submitted to ABS for review.

For a new technology requesting qualification through the NTQ process, a risk assessment is to be performed/updated at each stage as applicable. The risk assessment within the NTQ process will vary from qualitative to quantitative depending on the maturity level and information available at that stage. The primary objective of the risk assessment is to identify technical risks and uncertainties associated with the proposed design and document all foreseeable hazards, their causes, consequences, and potential risk control measures considering the new technology in its proposed application and operating environment. All possible interfaces, and known integrations are to be evaluated as part of this assessment.

All risk assessments performed must consider the following areas:

- i) Personnel safety
- ii) Asset protection
- iii) Environmental protection

It is recommended that the risk assessment be carried out by a multidisciplinary team that includes the design team (vendor) and the end-user. ABS' participation in the risk assessment is also recommended. Appendix 2 of the *ABS Guide for Risk Evaluations for the Classification of Marine-Related Facilities* provides an overview of how to assemble an appropriate risk assessment team.

Prior to performing the risk assessment, a risk assessment plan should be prepared and submitted to ABS for review. The risk assessment plan should include the following information:

- i) Scope of the Assessment
  - a) Description of the proposed new technology including physical and operational boundaries
  - b) Intended service application of the new technology
- ii) Assessment Team
  - a) Subject matter experts/participants/risk analysts, including their background and areas of expertise
- iii) Assessment Preparation
  - a) All available new technology information (e.g., design basis, drawings, procedures, etc.),
  - b) Proposed risk assessment method (e.g., FMECA)
  - c) Proposed risk assessment criteria for evaluation (e.g., risk matrix)

After the risk assessment has been completed, a report that includes the following information should be submitted to ABS for review:

- i) Scope
  - a) Description of the proposed new technology including physical and operational boundaries
  - b) Intended service application of the new technology
- ii) Risk Assumptions and Data References
- iii) Supporting Engineering Documents
  - a) Technical drawings
- iv) Risk Assessment Worksheets (Hazard Register) that
  - a) Identifies hazards associated with the new technology in its current boundary conditions (application and operating environment),
  - b) Identifies scenarios associated with each identified hazard,
  - c) Identifies causes of the hazardous scenario,
  - d) Identifies consequences of the hazardous scenario,
  - e) Identifies existing risk control measures for each hazardous scenario,
  - f) Estimates the likelihood (frequency) and the severity of the consequence,
  - g) Evaluates the risk of the hazardous scenario by measuring it against the acceptable risk criteria agreed upon by the analysis team,
  - h) Identifies and evaluates the need for any recommendations to lower the risk to acceptable levels (design improvements through risk control measures)
- v) Conclusions and Recommendations
  - a) Action items and/or recommendations

Further guidance on developing basic and detailed risk assessment plans can be found in Section 5 and Section 6, respectively of the *ABS Guide for Risk Evaluations for the Classification of Marine-Related Facilities*.

It is recognized that each new technology may be unique in terms of design, operating environment, and application, therefore it is difficult to provide precise guidance on which risk assessment techniques should be used in a given situation. Therefore the selection of risk assessment methodology should be considered on a case-by-case basis and discussed with ABS prior to performing a risk assessment. Some typical recommended risk assessment techniques and their common uses can be found in Section 2, Table 2.

**TABLE 2**  
**Recommended Risk Assessment Techniques**

<i>Type of Study</i>	<i>Description</i>	<i>Common Uses</i>
HAZID	A method to rapidly identify hazards, assess potential consequences, and evaluate existing safeguards of the system. Methods draw upon a highly experienced multi-disciplinary team using a structured brainstorming technique to assess applicability of potential hazards.	<ul style="list-style-type: none"> <li>Used for all types of systems and processes.</li> </ul>
FHA	A functional hazard assessment (FHA) is used to identify and assess the functional failures of a system or subsystem.	<ul style="list-style-type: none"> <li>Used for all types of systems and processes.</li> </ul>
FMEA (Failure Mode and Effects Analysis)	An FMEA is a reasoning approach best suited to reviews of mechanical and electrical hardware systems. The FMEA technique (1) considers how the failure modes of each system component can result in system performance problems and (2) makes sure the proper safeguards are in place. A quantitative version of FMEA is known as failure modes, effects and criticality analysis (FMECA).	<ul style="list-style-type: none"> <li>A design FMEA/FMECA can be used for reviews of mechanical and electrical systems (e.g., fire suppression systems, vessel steering and propulsion systems) to identify design related failures.</li> <li>A process FMEA is often used to identify failures while performing steps within a given process or procedure (e.g., manufacturing, assembly).</li> </ul>
Hazard and Operability (HAZOP) analysis	The HAZOP analysis technique uses special guide words for (1) suggesting departures from design intents for sections of systems and (2) making sure that the proper safeguards are in place to help prevent system performance problems.	<ul style="list-style-type: none"> <li>Used for finding safety hazards and operability problems in continuous process systems, especially fluid and thermal systems. It can also be used to review procedures and other sequential or batch operations.</li> </ul>

Further guidance on risk assessments techniques can be found in the following references:

- *ABS Guidance Notes on Failure Mode and Effects Analysis (FMEA) for Classification*
- *Petroleum and Natural Gas Industries – Offshore Production Facilities – Guidelines on Tools and Techniques for Hazard Identification and Risk Assessment, ISO 17776*
- *Risk Management – Risk Assessment Techniques, ISO 31010*
- *Guidelines and Methods for Conducting the Safety Assessment Process on Civil Airborne Systems and Equipment, SAE ARP 4761*

### 9.3 Engineering Evaluation

Engineering evaluations are used to verify and validate that the new technology is capable of performing acceptably with respect to intent and overall safety according to the requirements of each stage. This is achieved gradually for each qualification stage through specific qualification activities as the technology matures and can be found in the NTQP. The types of activities for engineering evaluation are:

- i) *Review Engineering Design Requirements.* As the technology matures, and more detailed design information becomes available, the functional and performance requirements are reviewed/updated as needed.
- ii) *Technical Analyses and Simulations.* Engineering design analyses and simulations are used to verify the technology at the earlier qualification stages
- iii) *Validation Testing.* Functional, model testing, and prototype testing are used to verify that the new technology satisfies all the specified functional and performance requirements.
- iv) *Interface Analyses.* Interface analyses of the technology with existing systems are required and system integration testing is needed in order to fully understand all interactions between the new technology and surrounding systems, including people and the environment.
- v) *Verification of Operability.* Operational testing and the collection of test data are required to verify the new technology satisfy the operational requirements.

- vi) *Verification of Inspectability and Maintainability.* The various components of the new technology must be reviewed to confirm that they can be monitored, inspected and maintained in a manner consistent with existing practice.
- vii) *Quality Assurance and Quality Control (QA/QC) Program.* Establish and maintain an effective quality control procedure(s) and quality acceptance criteria at each stage in accordance with recognized industry standard.

## 9.5 Design Improvements

Based on the results of the engineering evaluation and risk assessment activities, design improvements may be necessary to enhance reliability and safety of the design. The opportunities to improve safety could be through changes or modifications that make the design inherently safer or implementation of appropriate risk control measures. Example design changes include, material changes, reconfiguration, redundancy, and loading requirements.

Any design improvements that are identified and determined necessary as part of further refinement of the new technology is to be re-evaluated against the functional and performance requirements outlined in SRDD. The updated qualification activities should aim to meet these new requirements. Design improvements should be tracked in the NTQP.

The following sections should be considered when improving the design of any new technology.

### 9.5.1 Hierarchy of Risk Control Measures

Inherently safe design exists in something as a permanent and inseparable element. In other words, the risk control measures in place are “built in”, not “added on”. Identification of measures to control risks identified throughout the qualification process can be summarized in the following list:

- i) *Elimination or Substitution.* Elimination of the design element, or the hazard associated with it should always be the first consideration. Careful evaluation may indicate that the functional requirements may be accomplished by another design element.
- ii) *Engineering.* Engineering controls are mechanical or physical features added to the equipment, systems, subsystems, and/or components in order to remove or control the hazard, either by initial design specifications or by applying methods of substitution, minimization, isolation, or ventilation.
- iii) *Administrative.* Administrative controls rely more actively on human action and behavior. Examples of administrative controls include written operating procedures, maintenance and inspection strategies, checklists, safety meetings, alarms, signs, training of personnel.
- iv) *Personal Protective Equipment.* Personal protective equipment (PPE) creates a barrier between the person wearing the PPE and the hazard associated with the job. PPE such as hearing protection, protective clothing, safety glasses, respirators, gloves, welding aprons, and hardhats are methods of controlling hazards.

In general, inherently safe design is more of a philosophical way of thinking rather than a specific set of tools or methods. For example, a hazard might be considered “safe” because it has specific risk reducing measures in place. Inherently safe design asks the question, “can it be safer?”

The goals of inherently safe design can be summarized by the following:

- Fewer and smaller hazards
- Fewer causes that initiate hazardous events
- Reduced severity and consequences (e.g. fatalities, lost time incidents, asset damage, etc.)
- More effective management of residual risk

The inherently safe design approach to achieve goals of safer design should consider elimination or substitution to significantly reduce hazards. The following questions should be asked when considering the design of new technologies with hazardous potential:

1. Can the hazard be eliminated by design improvements?
2. If not, then can the magnitude of the hazard be reduced?
3. Do the alternative designs identified in question 1 and 2 increase the magnitude of other hazards or present new hazards?
4. What other risk control measures (engineering or administrative) are required to manage hazards that remain?

An inherently safe design approach to design improvements is recommended in order to eliminate design elements that are limiting the new technology from meeting defined functional and performance criteria. This philosophy should shift focus on improving design by implementing elimination, substitution, or engineering risk control measures.

### 9.5.2 Management of Change

Design improvements are inevitable during the course of technology design and development and are integral to the process, especially during the early design phases. These improvements can potentially have an impact on risk, and on previously performed qualification activities during the NTQ process. For this reason, it is important that clients establish an appropriate Management of Change (MoC) program. It is recommended that a MoC program be developed to confirm that design improvements are reviewed in a responsible manner by appropriate personnel.

A MoC program is a combination of policies and procedures used to evaluate the potential impacts of a proposed design improvement so that it does not result in unacceptable risks. Developing an effective MoC strategy requires establishing, documenting, and successfully implementing formal policies to evaluate and manage both temporary and permanent modifications including equipment, materials, procedures and conditions.

The techniques used to evaluate the improvement, the people available for review, the time frames for reviewing and implementing the improvement will differ between the design phases. During the early phases, there may be many design improvements, but there will be fewer records to update than if the improvement occurs at a later stage. Tools such as software simulations and preliminary risk analysis can prove extremely valuable when determining design improvements at early stages and are less labor intensive than in later stages.

An effective MoC program requires preparation beyond defining and documenting a policy to outline the system. The following factors are important to successful implementation of a MoC program:

- i) Clear roles and responsibilities
- ii) Appropriate organizational preparation
- iii) A written MoC program manual that includes MoC forms
- iv) Pilot roll-out before the full-scale deployment, training of affected personnel, and
- v) Close attention when integrating MoC with existing programs.

The following references provide more details on Management of Change processes:

## SECTION 3 Feasibility Stage

### 1 Introduction

A new technology considered for qualification in the Feasibility stage is at an early concept maturity level, where basic research and development activities to identify engineering principles are complete; and a concept formulated along with its functional requirements. A high-level design analysis is performed to verify the concept in the intended application and that the overall proposed level of safety is comparable to those established in Rules, Guides, other recognized industry standards and recommended practices.

In cases where multiple concepts are submitted for ABS review, the overall objective is to work with ABS to identify a concept that proves most feasible for the application with respect to safety and reliability.

### 3 Qualification Activities

#### 3.1 Engineering Evaluation

The engineering evaluation at the Feasibility Stage involves a high-level design verification of the proposed concept. All goals, functional requirements, and performance requirements submitted as part of the SRDD in 2/3.3 are reviewed along with any available high-level engineering design analysis to verify that the proposed concept is feasible.

#### 3.3 Risk Assessment

A high-level risk assessment should be carried out during this stage to identify any preliminary technical risks and uncertainties associated with the proposed concept. The risk assessment should focus on documenting all foreseeable hazards, their causes, consequences, and potential risk control measures considering the new technology in its proposed application and operating environment. Additionally, all possible interfaces and known integrations should be considered. This risk assessment should set the basis for any subsequent qualitative/quantitative assessments that may need to be performed to completely understand the new technology's risk profile. Subsequent assessments may be in the form of additional engineering evaluation or risk assessments.

The results of the risk assessment should be documented and tracked in a hazard register for assessment and implementation in future qualification stages. The primary function of the hazard register should be to demonstrate that hazards and appropriate risk control measures have been identified. Recommendations for additional risk assessments and engineering evaluations are to be documented and submitted as part of the NTQP.

An appropriate risk assessment technique should be selected for this high-level risk assessment and submitted to ABS for review in the form of a risk assessment plan as discussed in 2/9.1. The engineering evaluation documents that support the risk assessment should be available and at an appropriate level of maturity before the risk assessment is performed. The following high-level risk assessment techniques are recommended as options for identifying preliminary technical risks:

- i)* HAZID identifying possible hazards, events, and outcomes related to the impact on personnel, asset, environmental, and reputation
- ii)* Functional FMEA identifying possible failure modes, effects (local and global), causes, and preliminary safeguards including all interfaces (i.e. system to system, system to subsystem, etc.)
- iii)* Functional Hazard Analysis (FHA) identifying system/sub-system functions and hazards associated with those functional failures

A risk assessment report including the hazard register should be prepared. The risk assessment report and the NTQP should be submitted to ABS for review.

There may be specific cases where the information available at this maturity level is limited and a risk assessment technique may not be possible. This scenario will be treated on a case-by-case basis, and ABS will recommend an alternative approach as needed to meet the new technology Feasibility Stage requirement.

## 5 Summary of Submittals

The following qualification activities along with future activities for the Concept Verification Stage should be highlighted in the NTQP and submitted to ABS for review:

### 5.1 Engineering Evaluation

*i)* SRDD

- Design basis, functional specification and/or technical specification of the new technology
- System and function architecture details such as functional flow block diagram
- Design details such as basic engineering drawings and engineering principles associated with further development
- Design analysis methodology and any available preliminary results
- Details regarding physical and functional interface requirements (mechanical, hydraulic, electronic, optical, software, human, etc.)
- Applicable design references, codes, standards and guidelines, and technical justification for any proposed deviations (may be identified independently or during the new technology screening process)
- Lessons learned, references and examples of comparable designs

### 5.3 Risk Assessment

- i)* Risk assessment plan in accordance with 2/9.1
- ii)* The appropriate risk assessment report identified in 3/3.3
- iii)* Hazard Register complete with an action tracking system

## 7 Feasibility Stage Completion: Technology Feasible

Once the above deliverables have been submitted to ABS for review and all specified performance requirements have been verified, then a Statement of Maturity will be issued stating that the technology is feasible. The technology is now ready to proceed to the Concept Verification Stage.

## SECTION 4 Concept Verification Stage

### 1 Introduction

The second stage of the NTQ process is the Concept Verification Stage. The new technology is verified as performing its functions in accordance with defined performance requirements. This is accomplished by performing more detailed engineering studies and physical (or virtual) model testing. Reliability testing of select items may be performed. The operating conditions and the relevant environment are further refined. The functional and performance requirements outlined in the SRDD are re-evaluated, verified, and updated (as needed). The interfaces between configurations are verified against functional and performance requirements.

In addition, the production strategy is developed in the form of a preliminary manufacturing plan. A design risk assessment is carried out to identify technical risks related to design failures. Risk assessments from the Feasibility Stage are reviewed and updated (as needed) based on the design development in this stage.

### 3 Qualification Plan Activities

#### 3.1 Engineering Evaluation

##### 3.1.1 Engineering Design Review

At the Concept Verification Stage, the concept is confirmed and the engineering design is performed to verify that the functionality and performance of the new technology can be satisfied. The subsystem and component level requirements following the systems engineering approach should be defined if not specified at the Feasibility Stage. The objective is to define complete and consistent requirements that an item should have and confirm that the design correctly and completely captures each specification in the system requirements.

The performance requirements should state how the technology will perform its function and how the system requirements will be met. The performance requirements are to be established and should be detailed enough that the technology can be evaluated against the expected performance criteria. In addition, the requirements for the integration of subsystems and components into system prototypes should be defined. The overall configuration of the system should be provided and a preliminary interface analysis should be performed to verify the interfaces between configurations.

Design constraints should be identified and incorporated into the system requirements and design documentation. At this stage, the system requirements should be stated in quantitative measures that can be verified by subsequent numerical or analytical models and model tests. The overall system requirements defined at the Feasibility Stage should be reviewed to confirm continued relevance. Any change should be reviewed and documented with technical justification.

A preliminary manufacturing plan should be developed and should include the manufacturing methods and processes, the facilities, the production schedule, and the quality assurance requirements. The materials used in the system should be determined and reviewed during the qualification process. The technology design documentation is to be submitted for ABS review.

### 3.1.2 Functional and Model Testing

Tests are an essential part of the NTQ process and they can demonstrate the performance of the new technology. The types of tests required depend on the novelty of technology itself and pre-existing experience with similar concepts.

Functional and model tests are used to verify the functionality of the system and its ability to meet the defined functional requirements. Testing is to be performed in the technologies anticipated environment and operating conditions. The objectives of the functional testing are to verify that the system meets the performance and reliability requirements, as well as to verify the results obtained from the analytical models. The functional testing should consider and address the critical failure modes identified during the risk assessments.

For the new materials or those that can have a significant effect on the performance of the system, destructive or non-destructive testing should be used to identify the relevant failure modes and mechanisms or to explore the critical parameters and their effects. The same raw materials or components stated in the material specification for the actual product should be used in the tests. For materials that will degrade over time, materials degradation testing should be performed. Accelerated testing methods may be used to test the lifetime performance of the materials in a shorter time. Additionally, reliability testing for select items may be required.

Before performing any testing, a test plan should be developed and submitted to ABS. The test plan should document the test setup and strategy that will be used to verify that a product meets its design specifications and other requirements. The specific test plans should include the assumptions and constraints, input data, test procedures, expected test results, the parameters to be measured, instrumentation system specifications, and the acceptance criteria for evaluating results. For certain tests, it may be required for an ABS Surveyor to witness the testing activities to verify that it meets performance requirements and confirm the presence of an effective quality control program. Further guidance on function and model testing can be found in references [10], [11], [12] and [13] listed in Appendix 1.

## 3.3 Risk Assessment

The objective of the risk assessment in this stage is to identify technical risks associated with the new technology design to the lowest level of indenture as practicable. The updated concept level design engineering documentation from the Feasibility Stage and the additional engineering documents developed in this stage serve as input to the risk assessment. This design risk assessment should take into account the following:

- Any design modifications from the Feasibility Stage
- Updated functional and performance requirements
- Updated configurations
- Possible interfaces and integrations
- All potential failure modes, failure causes and failure mechanisms in all expected operational modes and life cycle stages
- The effectiveness of existing risk control measures and the need for any additional or more reliable measures
- Closing out any action items (qualification activities) as agreed in the Feasibility Stage

Based on the findings of this risk assessment, additional qualification activities in the form of risk assessments or engineering evaluation may be required to further assist in identifying and assessing the full potential ranges of failure causes, failure mechanisms, consequences and any related uncertainties. These additional studies may be coarse, detailed, or a combination depending on the objective of the study. The results of the risk assessment should be documented and tracked in a hazard register for assessment and implementation in future qualification stages. The resulting qualification activities should be documented within the NTQP. A risk assessment report including the hazard register should be prepared. The risk assessment report and the NTQP should be submitted to ABS for review.

A risk assessment technique that is appropriate for reviewing the new technology design should be selected and submitted as part of the risk assessment plan to ABS. Potential design related failure events in all anticipated operational modes should be evaluated. Typically, for hardware or mechanical systems, a Failure Mode Effects and Criticality Analysis (FMECA) is recommended. The FMECA performed can help evaluate failure modes and corresponding failure causes, failure mechanisms, and the local and global effects of failure. It also includes a criticality analysis which is used to estimate the probability of failure and the severity of the associated consequence. The probability can be qualitative if lacking historical quantifiable data, but quantitative probabilities are preferred. The method of assigning criticality should be included within the risk assessment plan and agreed by ABS prior to the study. Results from the FMECA should be relayed back to the design process of the new technology to facilitate any design improvements or FMEA verification activities. Further guidance on FMECA and related verification activities can be found in the *ABS Guidance Notes on Failure Mode and Effects Analysis for Classification*.

The following risk assessments verifying all technical risks are to be performed and submitted to ABS for review.

- i) Design risk assessment (e.g., FMECA) as described above.
- ii) Update Feasibility Stage risk assessments as needed based on updated design documentation.
- iii) Perform any additional risk assessments identified while verifying the design and/or updating previous risk assessments.

If reliability, availability and maintainability (RAM) targets are defined as part of the functional requirements then a preliminary system RAM analysis should be carried out in this stage. System modeling techniques such as reliability block diagrams (RBD), fault tree analysis (FTA), Markov state diagrams or other established methods should be used to demonstrate the ability of the system to meet the defined performance requirements. The FMECA serves as input to the system reliability models along with the other engineering documentation developed at this stage. A RAM analysis should be prepared and submitted for ABS review. The data sources used, their applicability and any related assumptions should be documented within this report.

## 5 Summary of Submittals

The following qualification activities along with future activities to be addressed in the Prototype Validation Stage should be highlighted in the NTQP and submitted to ABS for review:

### 5.1 Engineering Evaluation

- i) SRDD
  - a) Documents that describe the concept verification design requirements
  - b) Design documents that include but not limited to the configuration, drawings, PFD/P&ID, analytical models, etc.
  - c) Functional and model test plans, test data (as requested), and test results
- ii) Preliminary manufacturing plan

### 5.3 Risk Assessment

- i) Updated risk assessments from the Feasibility Stage (as applicable)
- ii) Updated Hazard Register with updated action items closed out
- iii) Preliminary design risk assessment (e.g., FMECA) report
- iv) Preliminary system RAM analysis report (as applicable)

## 7 Concept Verification Stage Completion: Concept Verified

Once the above have been submitted to ABS for review and all specified performance requirements have been verified, then a Statement of Maturity will be issued stating that the concept has been verified. The technology is now ready to proceed to the Prototype Validation Stage.

## SECTION 5 Prototype Validation Stage

### 1 Introduction

The third stage of the NTQ process is the Prototype Validation Stage. New technology that has matured to this stage has previously completed conceptual functional, performance, and reliability testing in nonspecific environments. The main objective in this stage is to validate with a prototype what was verified in the Concept Verification Stage.

During this stage, the technology is further developed to the point where a prototype or full scale production unit can be manufactured. All engineering studies and design risk assessments are completed and the design is refined to the detailed design. Engineering documents such as detailed drawings, product specifications, manufacturing plan and qualification test procedures are all fully developed. A preliminary system-of-systems interface analyses may be performed and system integration testing plan developed. Process risk assessments may be carried out (as needed) to evaluate relevant procedures and further refine them.

A prototype or full scale production unit is manufactured and all necessary qualification testing is carried out to validate the design. After completing this stage, the new technology has demonstrated that it can perform within the established performance requirements in a simulated or actual environment for an extended period of time.

### 3 Qualification Plan Activities

#### 3.1 Engineering Evaluation

##### 3.1.1 Engineering Design Review

At the Prototype Validation Stage, the engineering design is to confirm that the overall system, down to the lowest component level, has satisfied all system requirements. The performance requirements a technology must meet should be finalized and measurable. In addition, the requirements for system integration, installation, commissioning, operation, maintainability, and decommissioning should be established.

At this point the system has reached the necessary level of maturity to start fabricating, integrating, and testing. Changes in the requirements defined for any items during the previous stages should be reviewed and documented with technical justification.

At this stage, all design analyses and configuration definitions are completed and all design decisions that are outstanding are to be finalized. It is noted that there may be a need to revisit certain analytical and other relevant studies based on results of the prototype test. Detailed drawings including all dimensional requirements, process and instrument details, safety features and ancillary systems are completed as applicable. For load bearing components, all relevant loading and the uncertainty in that loading are analyzed. For process and electrical systems, all associated potential system failure/breakdowns and their associated failure frequencies (if applicable), as well as the consequence and impact on the system from each failure are identified.

In addition, all information (e.g., drawing and data) required for the production of the system are to be finalized. The actual performance of the new technology should be evaluated during prototype testing and compared against existing designs if available. The aforementioned design engineering documents are to be submitted to ABS for review. A preliminary system-of-systems interface analyses and system integration testing plan may be developed at this stage and submitted to ABS for review before the System Integration Stage.

### 3.1.2 Prototype Testing

Prototype testing is intended to prove that the interactions between the systems/subsystems/components under relevant loading and environmental operating conditions can perform reliably as intended. Prototype tests can identify potential failure modes and mechanisms as well as the critical parameters, especially when operational experience in relevant environments is limited or unknown.

Prototype testing can be used to verify the analytical models and the assumptions made during the engineering design process. A test plan which details test techniques, test limits, expected test data, quality assurance requirements should be developed and submitted to ABS for review before prototype testing. Calibration of measuring devices is to be current with manufacturer's quality management system. Calibrations should be traceable to a recognized national standard (e.g., NIST, ANSI, etc.).

For certain new technologies, it may be very difficult to perform prototype testing in the actual environment. In this case, virtual prototype testing in a simulated environment can be performed. However, the virtual prototype testing must be reviewed by ABS to assess that the simulated environments are commensurate with expected operational practices. Analysis tools, such as finite element analysis (FEA) and computation fluid dynamics (CFD), and other methods used should be qualified for application. The prototype testing documents should include inputs, assumptions, boundary conditions, the computational models and appropriately conditioned/reported test results. Prototype test results should be documented and analyzed to determine whether the prototype satisfies specified functional and performance requirements in its actual environment. A prototype test report is to be submitted to ABS for review. Further guidance on prototype testing can be found in references [10], [12], [13] and [14] listed in Appendix 1.

### 3.1.3 Manufacturing

A manufacturing plan should be finalized that includes the manufacturing methods and processes, the facilities, the production schedule, and quality assurance requirements. Quality assurance of the manufacturing process should confirm that the product meets the required specifications. The manufacturing plan should be submitted to ABS for review. Further guidance on developing a manufacturing plan can be found in references [15], [16] and [34] listed in Appendix 1.

### 3.1.4 ABS Survey

Survey during the manufacturing process and prototype testing may be required. The vendor should submit an Inspection Test Plan (ITP) to ABS for review. The ITP should define witness points and hold points as agreed between the vendor and ABS. The ABS Surveyor should witness the manufacturing process and prototype testing to verify that proper manufacturing and prototype testing processes are followed and it meets the quality assurance requirements.

## 3.3 Risk Assessment

The main objective of the risk assessments performed in the Prototype Validation Stage is to validate the final design of the new technology. The design risk assessment (e.g., hardware design FMECA) from the Concept Verification Stage should be reviewed and updated to evaluate changes made to the design and/or other aspects of the new technology description. Changes made to one part of the design or new technology design requirements could have the potential to introduce new technical risks to other previously evaluated parts. The results of other qualification activities in this stage may also serve as input to the updated design risk assessment. Follow-on qualification activities determined from the results of the updated design risk assessment should be included within the NTQP.

For certain new technologies with high consequence severity levels upon failure, if not already addressed by other risk assessments, ABS may recommend that an additional process risk assessment (e.g., process FMECA or HAZOP) is performed. The objective of this risk assessment is to evaluate the potential failures that could occur during specific steps as listed within the procedures. This process risk assessment typically evaluates procedures related to manufacturing (as defined within the final manufacturing plan), testing (prototype and systems integration), installation/integration, commissioning, operations and decommissioning. A risk assessment technique that is appropriate for reviewing these procedures should be selected and

submitted as part of the risk assessment plan to ABS for review. Typically, a process FMECA or HAZOP study is recommended. It is recognized that the scope of this risk assessment depends on the availability of relevant procedures. All interfaces should also be considered when performing this assessment. The recommendations from the study should be used by the engineering design team and the operations team to determine any design improvements or procedural changes necessary before finalizing the design and manufacturing.

Based on the findings of the final design risk assessment and process risk assessment (if applicable), a re-evaluation of all previous risk assessments should be considered. All previous risk assessments should be reviewed against any newly identified failure modes or hazards. Changes made to the design due to findings in these risk assessments should also be checked against the final functional and performance requirements.

Finally, all identified technical risks from the Prototype Validation Stage and risk assessments from previous stages should be appropriately managed through any necessary design improvements. All corresponding action items should be closed in order for the new technology to complete this stage of the NTQ process.

The following final design level risk assessments verifying all technical risks are to be performed and submitted to ABS for review:

- i)* Final design risk assessment (e.g., design FMECA)
- ii)* Final process risk assessment (e.g., process FMECA or HAZOP) if applicable
- iii)* Update all previous risk assessments as needed based on updated final design level documentation
- iv)* Final hazard register based on the final design with all actions items closed out

If applicable, the preliminary RAM analysis should be re-evaluated and finalized. The final RAM analysis report should be submitted for ABS review.

## 5 Summary of Submittals

The following qualification activities along with future activities for the System Integration Stage should be highlighted in the NTQP and submitted to ABS for review:

### 5.1 Engineering Evaluation

- i)* SRDD
  - Review engineering documents that describe the component requirements and the interaction between components, subsystems, and the overall system if applicable.
  - Detailed design documents including detailed drawings, product specifications, process and instrument details, detailed calculations, etc.
  - Prototype test plans, test data (as requested), and test results summarized in a report.
  - Additional qualification testing, data, and results identified in the design risk assessment (e.g., FMECA).
- ii)* Inspection Test Plan (ITP)
- iii)* Detailed manufacturing plan.

### 5.3 Risk Assessment

- i)* The final updated risk assessment reports from the Concept Verification Stage (as applicable).
- ii)* The final design risk assessment (e.g., FMECA) report.
- iii)* The process risk assessment (e.g., process FMECA) report (as applicable).
- iv)* The final system RAM analysis report (as applicable).
- v)* Final hazard register with all action items closed out.

**7 Prototype Stage Completion: Technology Qualified**

Once the above deliverables have been submitted to ABS for review and all specified performance requirements have been verified, then a Statement of Maturity will be issued stating that the technology has been qualified. The technology is now ready to proceed to the System Integration Stage.

**9 ABS Type Approval Program**

Upon completion of the Prototype Validation Stage of the NTQ process, the new technologies that are consistently manufactured to the same design and specification may be Type Approved under the ABS Type Approval Program to limit repeated evaluation of identical designs. During the Prototype Validation Stage, if all the engineering evaluations have been completed, a PDA can be issued prior to further consideration for ABS Type Approval.

## SECTION 6 Systems Integration Stage

### 1 Introduction

The fourth stage of the NTQ process is the Systems Integration Stage. In this stage, discussions between the vendor and end-user are held to understand the compatibility of the technology with final operating system and operating environment. An interface analysis is performed to confirm the compatibility of the item. The technical risks during operations that have not been addressed during previous risk assessments are evaluated and relevant reports updated. All necessary risk control measures are implemented.

The “Technology Qualified” item is then integrated (by installation) with the final intended operating system. All functional and performance requirements of the integrated system as outlined in the SRDD are validated through testing before (or during) commissioning. Plans for in-service survey, inspection, monitoring, sampling and testing (as applicable) are determined.

### 3 Qualification Plan Activities

#### 3.1 Engineering Evaluation

##### 3.1.1 System Interface and Integration Requirement

At this stage the overall technology goals and requirements may remain unchanged. However, specific requirements for system-of-systems functionality and interfaces should be finalized. In addition, the detailed operational performance parameters should be defined and operational procedures should be developed. System interface and integration requirements are to be submitted to ABS for review.

##### 3.1.2 Interface Analysis

It should be analyzed that the addition or incorporation of the new technology does not negatively affect the integrity of the surrounding systems and components. All necessary functional and physical interfaces (e.g., mechanical, electrical, environment, data, human, etc.) and other systems should be reviewed and verified that the new technology does not adversely affect those systems. At this stage, the interfaces should be specified in quantitative limiting values, such as interface loads, forcing functions, and dynamic conditions. The use of tables, figures, or drawings is recommended as appropriate. The vendor/end-user should provide detailed interface control methods or other engineering solutions so that the new technology is compatible with the integrated systems. The complete interface analysis and necessary engineering solutions are to be submitted to ABS for review.

##### 3.1.3 System Integration Testing (SIT)

The operational prototype is built and integrated into the final system. Full interface and function test programs are performed in the intended (or closely simulated) environment. The impact of the new technology on the performance and integrity of other systems as well as the impact of other systems on the new technology itself should be addressed. An initial operational test and evaluation should be performed to assess the operational effectiveness and suitability in the intended environment. The operational test must demonstrate that the operational aspects associated with placing the application in a marine or offshore environment are commensurate with typical operational practice for these facilities. Changes to the technology design or operational procedures may be necessary to address any issues encountered during operational testing. A test plan which details test techniques, test limits, expected test data, quality assurance requirements should be developed and submitted to ABS for review before the system integration testing. All test procedures and test results are to be summarized in a report and submitted to ABS for review.

#### 3.1.4 ABS Survey

Survey during the system integration testing may be required as agreed upon in the system integration test plan. ABS Surveyor will witness the system integration testing to verify that proper testing processes are followed and it meets the quality assurance requirements based on the witness points as agreed between the vendor/end-user and ABS.

An In-Service Inspection Plan (ISIP) to address in-service survey, inspection, monitoring, sampling and testing (as applicable) during operations should be submitted for ABS review.

### 3.3 Risk Assessment

The main objective of the risk assessments performed in the System Integration Stage is to evaluate any technical risks resulting from system integration and operations that have not been previously evaluated as part of the design risk assessment, process risk assessments or other risk assessments in the previous stages. The end-user should manage any additional/residual risks identified through appropriate risk control measures.

An appropriate risk assessment technique should be selected and submitted as part of the risk assessment plan to ABS for review. The use of a process FMECA, HAZOP or HAZID are recommended. The scope of this risk assessment typically includes installation, SIT, commissioning, operations and decommissioning. The assessment should consider all interfaces between the validated prototype and the connected system (system-of-systems). Follow on qualification activities may be determined from the results of the risk assessment such as engineering evaluation, testing, design improvements or procedure changes. These activities should be addressed within the NTQP. All risk control measures should be implemented and any outstanding action items from the risk assessment closed before proceeding with system integration testing and commissioning.

The need for updates to any previously submitted risk assessments or RAM analysis should be evaluated and addressed as appropriate. Updated risk assessment reports including hazard registers, RAM analysis (if applicable) and the NTQP should be submitted for ABS review.

## 5 Summary of Submittals

The following qualification activities along with future activities for the Operational Stage should be highlighted in the NTQP and submitted to ABS for review:

### 5.1 Engineering Evaluation

- i) SRDD
  - All documents that describe requirements for system-of-systems functionality and interfaces.
  - All documents that describe detailed operational procedures and performance parameters.
  - System integration test plans, test data, and test results summarized in a report.
  - Plans for in-service survey, inspection, monitoring, sampling and testing (as applicable) during operations or ISIP.

### 5.3 Risk Assessment

- i) Updated risk assessment reports from the previous stages (as applicable)
- ii) Other applicable technical safety studies (e.g., RAM).

## 7 System Integration Stage Completion: Technology Integrated

Once the above deliverables have been submitted to ABS for review and all specified performance requirements have been verified, then a Statement of Maturity will be issued stating that the technology is integrated. The technology is now ready to proceed to the Operational Stage.

## SECTION 7 Operational Stage

### 1 Introduction

The last stage of the new technology qualification process is the Operational Stage. New technology categorized as “Operationally Qualified” denotes that it has been integrated into the final system and has been operating successfully in service in the relevant operational environment.

Once the technology has been qualified at the Prototype Stage, it must be confirmed that the knowledge gained by the engineering and risk assessment tests and studies is fed into the operational stage, in order to monitor prior assumptions and predictions through in-service field verification. In other words, the first implementation of any new technology should be treated as a first time application to some extent. This Section will outline the necessary activities that must be completed and the information to be supplied to ABS during this stage. It is recommended that the qualification process involves members with operational background in this stage of the project. These members should become familiar with the results of all the previous qualification stages, if they had not participated from the start of the qualification process.

At this stage, the operational objectives, operating environment and the performance requirements established during design are reviewed and applied to define goals for in-service operation. Following successful operation and performance achievement of the goals in the actual operational environment, the technology can be granted a Statement of Maturity.

The activities of the Operational Stage are as follows:

- i) Implementation of in-service survey, inspection, monitoring, sampling and testing plans
- ii) Collection and analysis of reliability, availability, maintainability (RAM analysis) and other operational performance data as needed
- iii) Comparison of operational data above with previously specified performance requirements, goals and criteria
- iv) Performance of root cause analyses for any observed failure and using feedback to introduce modifications for improvement
- v) Comparison of observed parameters with any critical assumptions made during the previous qualification stages and updating calculations as necessary

It is to be noted that when applying these Guidance Notes for classification or certification purposes, the primary driver for classification acceptance will be safety even though there may be additional functional requirements (e.g., reliability, ability to perform as per operational design specification) defined by the client.

### 3 Qualification Plan Activities

The need and extent of special in-service qualification requirements are dependent upon the justifications and risk assessment results during the design and qualification process. System requirements have been started to be defined in the Feasibility Stage of qualification, and they have been updated in later stages as the design evolved. Such requirements have to be translated into specific and quantifiable performance requirements to be attained during operations. Additionally, any critical assumptions made in the risk assessment and engineering evaluations during the four previous qualification stages should be monitored to confirm that operational experience does not disprove them. Taking all the above into consideration, the vendor and/or end-user together with ABS should outline the necessary elements of in-service survey, inspection, monitoring, sampling and testing needed to gain confidence in the real world application of the new technology.

These special requirements can be integrated in the end-user's Asset Integrity Management program. Advanced inspection and maintenance approaches like Reliability Centered Maintenance (RCM) and Risk Based Inspection (RBI) are appropriate strategies to follow since they are based on reliability and risk goals. Data collection and management are very important activities to consider for the in-service qualification stage.

The amount of operational history that is sufficient to verify performance requirements during operations depends on several factors, including actual equipment run time, failure rate and exposure time to failure. Therefore, the time to reach the "Operationally Qualified" status for the proposed new technology will be determined on a case-by-case basis.

All records related to the inspection, monitoring, sampling and testing of the new technology as established by the agreed-upon operational qualification plan or ISIP should be kept and made available for review upon request by ABS at any time. These records will be reviewed periodically to establish the scope and content of the required surveys that should be carried out by ABS.

The following references contain additional guidance for in-service monitoring, sampling, testing and inspection plans:

- *ABS Guide for Hull Inspection and Maintenance Program*
- *ABS Guide for Building and Classing Subsea Pipeline Systems*
- *API RP 17N Recommended Practice Subsea Production System Reliability, Technical and Integrity Management*

## 5 Summary of Submittals

The output of this stage is a report reviewing the operational data collected, and demonstrating how the specified performance requirements and criteria have been met.

The following items are typical submittals that ABS would expect to receive annually in order to conduct an Operational Stage audit:

- Summary report of results of the inspection, monitoring, sampling and qualification testing activities
- Failure data analysis of critical components
- Non-conformance reports and corrective actions taken.

*Note:* In case of a non-conformance report for a critical component, ABS should be notified as soon as practical.

## 7 Operational Stage Completion: Operationally Qualified

Once the operational experience of the new technology has proven to be successful (i.e., according to the expected performance, for a satisfactory amount of time in the actual operating environment, and meeting criteria acceptable by ABS), then a Statement of Maturity stating the operational qualification of the technology will be issued.

## APPENDIX 2 Comparison of ABS Qualification Stages with Industry TRLs

### 1 Introduction

Technology Readiness Levels (TRLs) are a method of estimating the maturity level of new technology. There are a wide variety of scales in industry based on the ISO 16290 standard. This standard uses a numerical scale one through nine, with nine representing the most mature. The American Petroleum Institute (API) uses a scale ranging from zero to seven. Although the definitions of these levels differ slightly (space systems vs oil and gas), the fundamental philosophy remains the same. ABS has developed a stage gate process compatible with the wide range of TRLs (API, US DoD, ISO 16290). However, the numbers levels presented have now been replaced by a series of qualification stages. Comparison of the ABS definition and the industry TRLs are provided in the table below.

**TABLE 1**  
**ABS Qualification Stages Comparison with Various Industry TRLs**

<i>ABS Qualification Stage</i>	<i>API RP 17N/Q TRLs</i>	<i>US DoD TRLs</i>	<i>ISO 16290 TRLs</i>
Feasibility Stage	0	1	1
	1	2	2
Concept Verification Stage	2	3	3
		4	4
Prototype Validation Stage	3	5	5
	4	6	6
System Integration Stage	5	7	7
	6	8	8
Operational Stage	7	9	9

## APPENDIX 3 New Technology Stage Determination

### 1 Introduction

In order to estimate the current qualification stage of a proposed a new technology, the following table should be used. These questions serve as general guidance to understand the design maturity of the technology based on completed qualification activities and hence determine the corresponding qualification stage. The client's design team, ABS, and other identified stakeholders should agree upon the qualification stage identified. All supporting documentation justifying affirmative answers are to be submitted to ABS for review. Negative answers will be reviewed on a case-by-case basis in order to determine applicability of the question to the technology.

<i>Qualification Stage</i>	<i>Item #</i>	<i>Question</i>	<i>Yes/No/NA</i>	<i>Evidence to support?</i>
Feasibility Stage	1	Has what is specifically new and/or unique about the concept been clearly identified?		
	2	Has what specifically needs qualification been defined?		
	3	Have potential applications been identified?		
	4	Have fundamental objectives and requirements (e.g., RAM) for the identified application been identified?		
	5	Have basic functionality and durability of the technology been analyzed?		
	6	Have basic principles been observed and reported?		
	7	Have lessons learned from similar technology been reviewed and documented?		
	8	Have basic design calculations been performed?		
	9	Have conceptual research and development been completed?		
	10	Has a preliminary list of reliability drivers been prepared?		
	11	Has a preliminary fitness assessment (physical interfaces, human etc.) been performed?		
	12	Can engineering drawings (basic configurations, interfaces, and/or PFD's or flow charts) and calculations be submitted for review?		
	13	Have any early stage risk assessment and mitigation studies been performed and documented?		
Concept Verification Stage	14	Has the concept functionality been demonstrated by physical models or "mock-ups"?		
	15	Have laboratory scale material testing and degradation mechanisms been performed?		
	16	Have all conceptual design engineering studies been completed?		
	17	Have preliminary function/performance/reliability engineering studies been completed?		
	18	Have reliability drivers been confirmed?		
	19	Is there documentation that RAM requirements can likely be met?		
	20	Has durability been confirmed by testing or calculation?		
	21	Has a viable manufacturing or fabrication scheme been documented?		
	22	Has preliminary qualitative design risk analysis (e.g., FMECA) been documented?		
	23	Have the initial risk assessments been reviewed/updated to identify any additional technical risks?		

**Appendix 3 New Technology Stage Determination**

<i>Qualification Stage</i>	<i>Item #</i>	<i>Question</i>	<i>Yes/No/NA</i>	<i>Evidence to support?</i>
Prototype Validation Stage	24	Have all items in the manufacturing of the technology been specified?		
	25	Has the manufacturing and assembly process been accepted?		
	26	Has a prototype or full scale production unit been manufactured?		
	27	Has the manufacturing and assembly defects been removed by stress screening?		
	28	Has the technology passed basic functionality testing of prototype (physical or virtual) or full scale product to demonstrate fitness and function capability in a simulated or actual operating environment?		
	29	Has a performance data collection system been established and properly documented?		
	30	Has the technology passed performance, durability, and accelerated life tests?		
	31	Is the degradation of function/performance within expected acceptable limits?		
	32	Has the technology passed system reliability analyses?		
	33	Has the operating/destruct limits been established or confirmed?		
	34	Has the degradation limits and rates been established or confirmed?		
	35	Has the required in-service monitoring needs and means been identified?		
	36	Has a process risk assessment (e.g., process FMECA) been performed and documented (if applicable)?		
	37	Has the final design risk assessment (e.g., FMECA) been completed for all life cycle modes (including assembly, transit, storage, installation, hook-up, commissioning, operation, decommissioning) for all interface permutations and properly documented?		
38	Have the residual risk and uncertainty been estimated and properly documented?			
39	Has the reliability study been updated and properly documented?			
System Integration Stage	40	Has the design risk assessment (e.g., FMECA, HAZOP) considering full system interfaces been updated and properly documented?		
	41	Have all other technical risks been identified/addressed and properly documented?		
	42	Has the technology been deployed into a full prototype and fully integrated with the intended system?		
	43	Has the function/performance when connected/integrated into a wider system been fully tested?		
	44	Have all mechanical, hydraulic, optical, electronic, software, etc. and human interfaces been fully addressed and documented?		
	45	Have all system integration requirements been confirmed?		
	46	Has installation/hook-up/testing/commissioning with a wider system been completed as per specifications?		
	47	Is there a data collection system in place to document performance and reliability?		
	48	Has a detailed in-service inspection/monitoring/sampling plan been defined and properly documented?		
	49	Can inspection/monitoring/sampling functionality be validated?		
Operational Stage	50	Has the technology demonstrated acceptable reliability and availability in the targeted operating environment?		
	51	Has the in-field service monitoring, sampling, and inspection plan been successfully implemented?		
	52	Has reliability and integrity performance data been properly collected, analyzed, and documented?		
	53	Have any underperforming components of the technology been identified?		
	54	If so, then has there been any reliability improvements for failed or underperforming components?		

**Appendix 3 New Technology Stage Determination**

---

<i>Qualification Stage</i>	<i>Item #</i>	<i>Question</i>	<i>Yes/No/NA</i>	<i>Evidence to support?</i>
Operational Stage (continued)	55	Has there been any performance feedback from projects or suppliers?		
	56	Have any unexpected aspects (e.g., interdependencies or influences on performance) or safety concerns been observed?		
	57	Has the technology been reliable for at least one survey (or maintenance or planned replacement) cycle or agreed upon time period as indicated in the SRDD or in-service inspection plan (ISIP)?		
	58	Has the design risk assessment (e.g., FMECA) been updated with in-service performance data?		
	59	Has the system reliability assessment been updated and properly documented?		

## APPENDIX 4 New Technology Qualification Plan (NTQP) Template

### 1 Introduction

The New Technology Qualification Plan (NTQP) should be a high level document that tracks the maturity level and status of qualification activities. These activities help verify and validate the new technology's ability to qualify all desired NTQ stages. The document is not meant to be a collection of engineering reports, methodologies, test data, or plans. The NTQP is to be updated throughout qualification process.

The following sections provide a recommended template for submitting an NTQP as part of the new technology qualification process.

### 3 New Technology Qualification Plan (NTQP) Template

#### **Executive Summary**

##### **1.0 Introduction**

- Summarize the project objectives.
- Provide an overview of the new technology and its application.
- Describe current status of design and qualification activities.
- Provide key points of contact.

##### **2.0 New Technology Screening and Stage Determination**

###### **2.1 System Requirements Overview**

- Summarize defined system goals, functional and performance requirements (with reference to appropriate SRDD document(s)).

###### **2.2 New Technology Screening**

- Summarize the new technology screening results.

###### **2.3 New Technology Stage Determination**

- Summarize the results of the new technology stage determination process.

##### **3.0 New Technology Qualification Activities**

- For each new technology item being qualified, list all qualification activities including the following details for each activity
  - Summarize the qualification activity (scope, objective and method)
  - Performance Requirement and its source.
  - Identify the stage in which this qualification activity was determined.
  - Provide reference to appropriate engineering evaluation report or risk assessment report (include corresponding hazard register nodes) from which this activity was determined.
  - Scheduled Timelines (start/finish).

- Provide reference to appropriate engineering evaluation or risk assessment reports that documents the results of the qualification activity.
- Comments from the Client & ABS

#### **4.0 References**

##### **Appendices:**

##### **Appendix 1 Summary of Previous Qualification Activities**

List all previously completed qualification activities prior to NTQ process with references to appropriate reports.

# Emissions Evaluation of a Large Capacity Auxiliary Boiler on a Modern Tanker

**Draft Final Report**

Prepared for

California Air Resources Board  
CARB

## **Disclaimer**

The statements and conclusions in this report are those of the contractor and not necessarily those of the California Air Resources Board (CARB). The mention of commercial products, their source, or their use in connection with material reported herein is not to be construed as actual or implied endorsement of such products.

## **Acknowledgments**

This report was prepared at the University of California, Riverside, Bourns College of Engineering-Center for Environmental Research and Technology (CE-CERT). The authors thank the following individuals for their valuable contributions to this project. These include Grace Johnson for her contribution for filter weighing and to the special cooperation with the test vessel, their crew, and the managing organization which will remain un-named, but recognized. Lastly, we would like to acknowledge the coordination and cooperation with CARB for these types of tests.

## Acronyms and Abbreviations

$\sigma$	standard deviation
BC	black carbon
CARB	California Air Resources Board
CE-CERT	College of Engineering-Center for Environmental Research and Technology (University of California, Riverside)
CFR	Code of Federal Regulations
cm/s	centimeters per second
CO	carbon monoxide
COV	coefficient of variation
CO <sub>2</sub>	carbon dioxide
DF	dilution factor
eBC	equivalent black carbon
EC	elemental carbon defined by thermal optical methods
EPA	United States Environmental Protection Agency
IMO	International Maritime Organization
ISO	International Organization for Standardization
kPa	kilo Pascal
lpm	liters per minute
ULSFO	low sulfur heavy fuel oil
MGO	marine gas oil
MFC	mass flow controller
ms	milliseconds
MSS	Micro Soot Sensor
NIOSH	National Institute of Occupational Safety and Health 5040 protocol
NIST	National Institute for Standards and Technology
NO <sub>x</sub>	nitrogen oxides
OC	organic carbon defined by thermal optical methods
o.d.	outer diameter
OEM	original equipment manufacturer
PM	particulate matter
PM <sub>2.5</sub>	fine particles less than 2.5 $\mu\text{m}$ (50% cut diameter)
PTFE	polytetrafluoroethylene
QC	quality control
SRL	sample reporting limit
scfm	standard cubic feet per minute
S	sulfur
SO <sub>2</sub>	sulfur dioxide
SO <sub>x</sub>	sulfur oxide
UCR	University of California at Riverside
Stdev.	Standard deviation one sigma

## Executive Summary

**Introduction:** More than ten years have passed since emissions were measured from the large auxiliary boiler on a Suezmax tanker while it unloaded about one million barrels of crude. Modern vessels use newer boiler designs so it is of interest to measure their emissions. The Alpha Laval unit is an Aalborg OL large capacity auxiliary boiler with a super heater, representative of a modern boiler for tankers. Alpha Laval is a market share leader so data from this unit should provide an important perspective on the emissions from widely-used tanker boilers with the latest technology advances. Further, ships operating within California waters now use low-sulfur distillate fuels so results from this test will show the combined effects of a modern boiler design and the cleaner California fuels.

**Methods:** The test methods utilized International Organization for Standardization (ISO) 8178-4 sampling protocols. The boiler was evaluated at one load representative of normal operation. The emissions measured were regulated gaseous, speciated hydrocarbons C2-C12, aldehydes and ketones, metals, particulate matter mass less 2.5  $\mu\text{m}$  ( $\text{PM}_{2.5}$ ), and PM composition which included elemental and organic carbon (EC and OC) PM. Other methods and practices, sampling dilution, and calculations such as dry to wet correction, followed ISO and Code of Federal Regulations (CFR) recommendations.

**Objectives:** The primary aim of this work is to study the in-use emissions from a modern tanker boiler utilizing California approved MGO low sulfur fuel.

**Results gaseous:** The boiler carbon dioxide ( $\text{CO}_2$ ) emissions were 3026 g/kg-fuel which is similar to previous testing of a modern auxiliary boiler on a container vessel suggesting the results are representative of a properly operated boiler. The nitrogen oxide ( $\text{NO}_x$ ) emissions averaged  $2.86 \pm 0.18$ , carbon monoxide (CO)  $0.06 \pm 0.064$ , and sulfur dioxide ( $\text{SO}_2$ ) 0.94 g/kg-fuel. The  $\text{NO}_x$  emissions were slightly higher, with-in 50%, to previous testing of a modern container vessel auxiliary boiler tested on low sulfur MGO and ULSFO fuels, but over two times lower (2.2) than the emissions on a tanker vessel auxiliary boiler tested on high sulfur HFO fuel.

**Results PM:** The  $\text{PM}_{2.5}$  emissions were  $0.022 \pm 0.004$  g/kg-fuel and were slightly lower compared to previous testing of a modern auxiliary boiler tested on low sulfur MGO and ultra-low sulfur fuel oil (ULSFO) fuels, but over 100 times lower (131) than the PM emissions on a boiler tested on high sulfur heavy fuel oil (HFO). The equivalent black carbon (eBC) emissions were  $0.0012 \pm 0.0004$  g/kg-fuel and were about the same for a previous modern boiler tested, but about 120 times lower than the EC emission reported for an older boiler tested on a tanker. The PM composition is mostly organic (68%) and about 1.5% elemental carbon.

**Results Toxics:** The boiler emissions for Formaldehyde, Acetaldehyde and Acrolein were 0.401, 0.376, and 1.749 mg/kg-fuel. These results compare well with the modern boiler operating on MGO fuel test from a container vessel. Modern boilers operating on MGO fuels appear to have lower Acetaldehyde and Acetone emissions compared to older boiler tested on HFO fuels. The PAMS measurements were at the detection limit of the measurement method and thus, could not be compared properly to the previous testing on an older boiler tested on a high sulfur HFO fuel. These results are useful for updating the model with “less than” type of values. **The metals emissions were... Waiting on data.**

***Summary:*** Modern boilers operating on MGO fuels have lower NO<sub>x</sub> and total PM mass compared to older boilers operating on high sulfur fuels. These results show the benefit of modern boilers operating on low sulfur MGO fuels.

# 1 Background

## 1.1 Marine Boiler Emissions

More than ten years have passed since emissions were measured from a large boiler on a Suezmax tanker while it unloaded about one million barrels of crude. Results of that project were peer reviewed and published (Agrawal et al 2008). The results were an all-inclusive set of regulated and nonregulated emissions factors for criteria pollutants (carbon monoxide (CO), nitrogen oxides (NO<sub>x</sub>), sulfur oxides (SO<sub>x</sub>), and particulate matter (PM) mass), a greenhouse gas (carbon dioxide (CO<sub>2</sub>)), speciated hydrocarbons needed for human health risk assessments, and a detailed analysis of the PM into its primary constituents (ions, elements, organic, and elemental carbon (EC and OC)). Details on the heavy fuel oil (HFO) and boiler design are found in the publication.

Modern vessels use newer boiler designs so it is of interest to measure their emissions. The boiler tested in this project was an Alpha Laval Aalborg OL large capacity auxiliary boiler with a super heater. Alpha Laval is a market share leader so data from this unit should provide an important perspective on the emissions from widely-used auxiliary boilers with the latest technology advances. Further ships operating within California waters now use low-sulfur distillate fuels so results from this test will show the combined effects of a modern boiler design and the cleaner California fuels.

Marine boilers, called auxiliary boilers, are used for supplying steam and hot water for non-propulsion uses such as fuel heating, galley, cabin space heating, and to drive steam turbines on tankers that offload petroleum crude oil in ports. Boilers can range in size where for container vessels and bulk carriers they tend to be smaller than the ones on a tanker vessel. The boiler tested in this research had a fuel consumption and exhaust flow rate ten times larger than the container vessel auxiliary boiler. Thus, tanker boiler emissions are a of importance to the California Air Resources Board (CARB) to estimate their environmental impacts.

## 1.2 Objective

The objective of this research is to evaluate the emissions from a modern auxiliary boiler on a tanker ship while it offloads fuel with-in a port in Northern California where the main engine is off. The testing followed the same protocol as used in the earlier study with one exception, the method used for measuring the nonregulated air toxics. Following the same protocol of the earlier study will allow a direct comparison of emissions and provide information on the changes in emissions over time.

## 2 Approach

This section outlines the in-use emissions testing approach for the modern boiler on a **xx-class** tanker vessel. This section describes the test article (boiler, fuel, and load point), sampling approach (sample location, sample discussions, and test protocol), measurements (gaseous and PM measurement methods, toxic sampling approach), calculations (exhaust flow determination), and a discussion of the assumptions used in the data analysis. The test article sections cover design details of the boiler operation. The sampling approach describes where the samples were collected from the exhaust, any impact this location may have on the measurement, and the test protocol. The measurements section describes the measurement methods for the gaseous, PM (mass and composition), and toxics samples. The corrections and assumption section provide a discussion on the data and analysis used in this report.

### 2.1 Test article

The boiler, fuel, and test matrix are described in this section.

#### 2.1.1 Boiler

The boiler tested is an Alpha Laval's large capacity auxiliary boiler (2xAalborg OL 50,000 kg/h) installed on a tanker vessel. This boiler design includes a super heater unit, 2xAalborg XW-S with a steam rating of 50,000kg/h. The boiler operation is automatically controlled. A diagram is presented in Figure 2-1 and the OL model specifications are provided in Table 2-1.

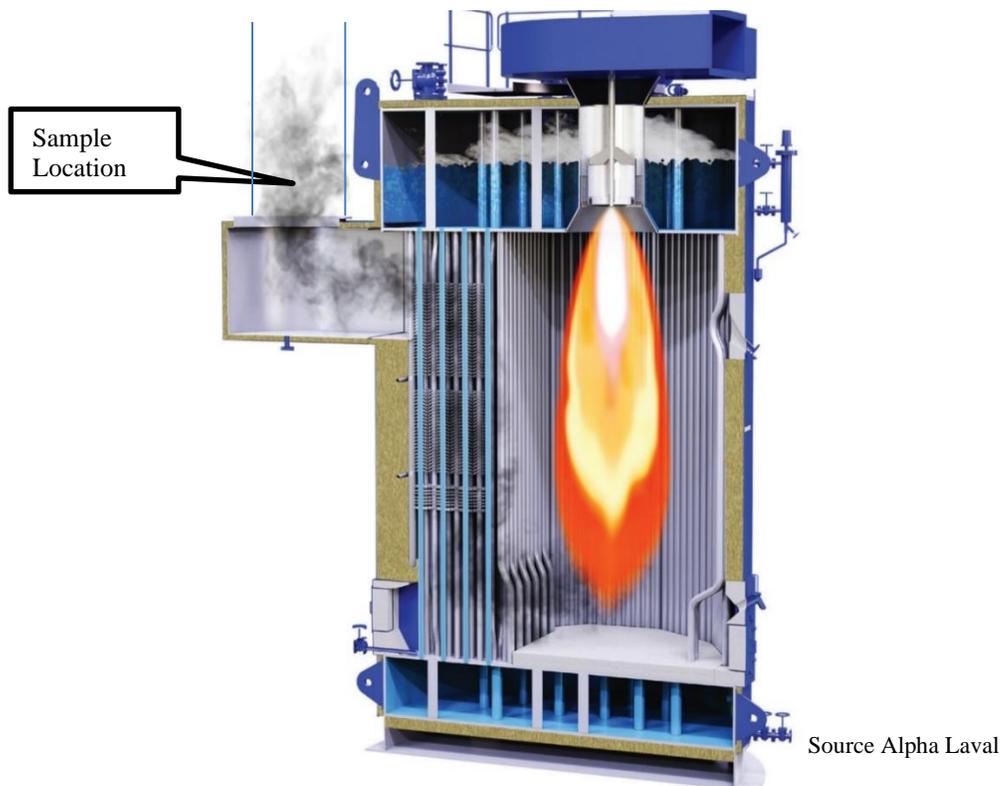

Figure 2-1 Design diagram of large frame boiler series

The test unit represents one of the larger boilers made by Alpha Laval. According to Alpha Laval’s brochure, the unit tested, rated at 50,000kg/h steam capacity, is a boiler near the highest level of steam production that is commercially offered. This suggests the boiler emissions will be of interest to regulators since it is one of the higher emission rate boilers in mass/time for this type of tanker activity.

**Table 2-1 List of Alpha Laval large frame boilers, 50,000 kg/h tested)**

Steam capacity	Design pressure	Thermal output at 100% MCR	Height K (incl. retraction of burner lance)	Diameter D (incl. insulation)	Hight H	Width B	Boiler dry weight*	Boiler operation weight
kg/h	bar(g)	kW	mm	mm	mm	mm	ton	ton
12,500	9	8,800	8,610	2,670	6,310	4,070	16.4	23.3
16,000	9	11,300	8,810	3,070	6,310	4,320	20.5	29.6
20,000	9 / 18	14,100	8,940	3,220	6,460	4,595	24.5 / 28.5	35.5 / 39.2
25,000	18	17,600	10,050	3,320	7,310	4,800	30.3	41.5
30,000	18	21,200	10,360	3,570	7,510	5,200	35.1	48.2
35,000	18	24,700	10,300	3,870	7,360	5,600	40.4	55.8

Source Alpha Laval

### 2.1.2 Test fuels

A standard low sulfur marine gas oil (MGO) fuel was used during this testing. The fuel complies with the CARB’s Fuel Rule for Ocean-Going Vessels, which allows either an MGO or a marine diesel oil (MDO) at or below 0.1% sulfur (S). A fuel sample was taken, and the results show the fuel sulfur was less than 0.1% (S = 0.045% following D4294 and X-ray methods, see Appendix D). The test fuel had a carbon weight fraction of 0.8682 and a hydrogen weight fraction of 0.1286, See Appendix D for analysis report.

### 2.1.3 Test matrix

Typically, a test matrix includes a range of loads, but boilers operation tends to be constant load with periods of on/off control to maintain steam pressure. The fuel oil flow in the boiler is relatively constant while the boiler produces the highest steam rate for the turbine pump needs during land-based transfers (as tested during this project). As the land-based tanks reach their capacity, the boiler fuel rate slows slightly to accommodate a switch-over in the storage tanks.

Figure 2-2 shows the steam rate and fuel consumption for a different, but similarly sized auxiliary marine boiler made by Mitsubishi. The 50,000 kg/h Mitsubishi steam rate boiler shows a maximum fuel oil consumption of 3,787 kg/hr. If we assume the maximum consumption between manufacturers is similar, we can estimate the load on the boiler tested as a percentage of maximum. The measured fuel consumption during this testing was 2,400 kg/hr, suggesting the boiler was operated at an estimated 65% of its maximum design load.

The crew suggested the boiler could be operated at this “65%” state and also at a slightly lower steam rate. As such, there was a desire to test these two load points, but due to time limitations, however, we only had time to test the higher 65% load condition and not the lower load condition. The data in this report represents the 65% load case at a fuel consumption rate of 2,400 kg/hr.

Boiler type		MAC -20B	MAC -25B	MAC -30B	MAC -35B	MAC -40B	MAC -45B	MAC -50B	MAC -55B
Evaporation	kg/h	~ 20,000	~ 25,000	~ 30,000	~ 35,000	~ 40,000	~ 45,000	~ 50,000	~ 55,000
Boiler design pressure	MPa	1.77							
Working steam pressure	MPa	1.57							
Steam temperature	°C	*Saturated temperature to 280							
Boiler efficiency (LHV base)	%	80.5				82.5			
Feed water temperature	°C	60							
Air temperature	°C	38							
Number of burners	-	1							
Fuel oil consumption	kg/h	1,552	1,940	2,328	2,716	3,029	3,407	3,787	4,165

(source Mitsubishi Heavy Ind.)<sup>1</sup>

## 2.2 Sampling approach

This section provides a discussion of the sample locations (PM representativeness and accessibility), and the test protocol (methods of sampling).

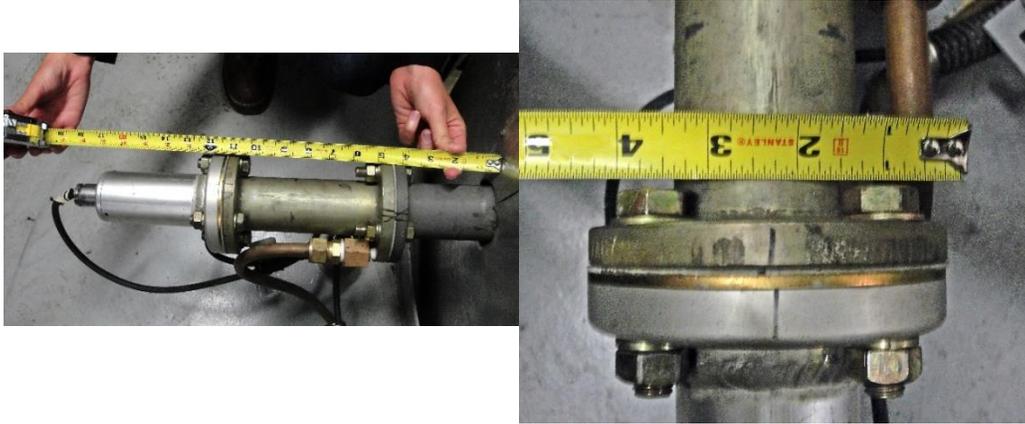

### 2.2.1 Sample locations

Sampling utilized UCR’s partial dilution tunnel system, as outlined in ISO 8178-1, with a direct connection to the exhaust sample, see Appendix A for more details. Several points of access to the exhaust were identified during a site visit months before the testing campaign. The recommended location identified was near the top of the boiler stack where a cross-plume smoke meter was installed. The plume smoke meter was disconnected during testing and reinstalled afterwards, see Figure 2-4 and Figure 2-5. This location is free of bends and is a good location for sampling.

**Figure 2-3 Platform space available for equipment (smoke meter shown)**

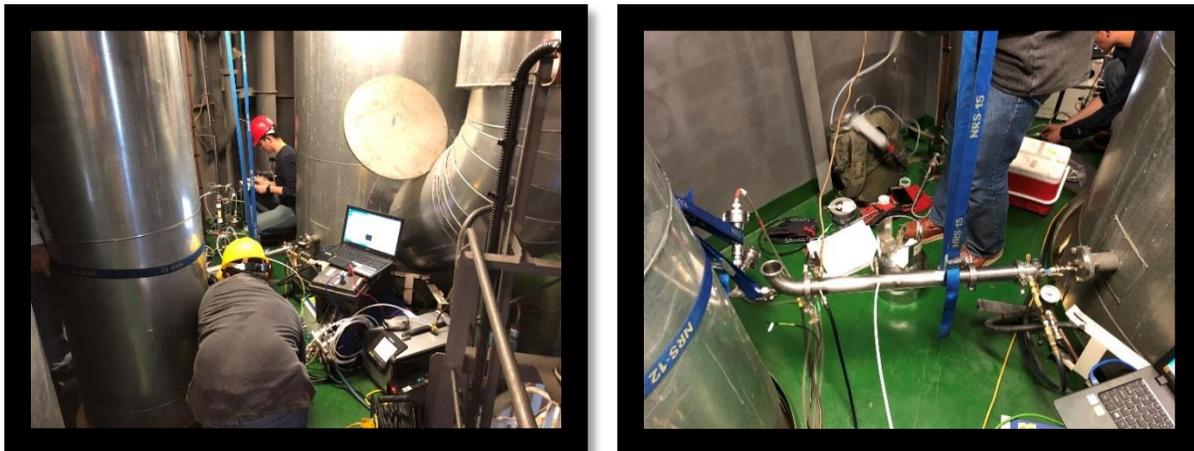

<sup>1</sup> [https://www.mhi-mme.com/products/boilerturbine/auxiliary\\_boilers.html#tab03\\_2](https://www.mhi-mme.com/products/boilerturbine/auxiliary_boilers.html#tab03_2) Auxiliary boiler project specifications.

**Figure 2-4 Dimensions for probe length and flange size**

There were no sample ports prior to the heat exchanging surfaces where one can measure the boiler emissions directly, as can be seen by the boiler layout shown in Figure 2-1. UCR, therefore, utilized the cross-plume smoke meter sample location as the only practical sample location. The length of the sample probe needed to be 12 inches to access a well-mixed exhaust sample using good engineering judgment (which is 10% inside the wall of the exhaust stack where the flow is well mixed). The dimensions show the probe design should be 12 inches, see Figure 2-4 and Figure 2-5.

The dilution tunnel length with the installed cyclone was interfering with the vessel stack to the left in the figure shown below, see Figure 2-5. The tunnel would fit with the cyclone removed. Since this was the only suitable sample location the cyclone had to be removed in order to collect any samples from the boiler. The impact of this decision is provided in Section 2.5.

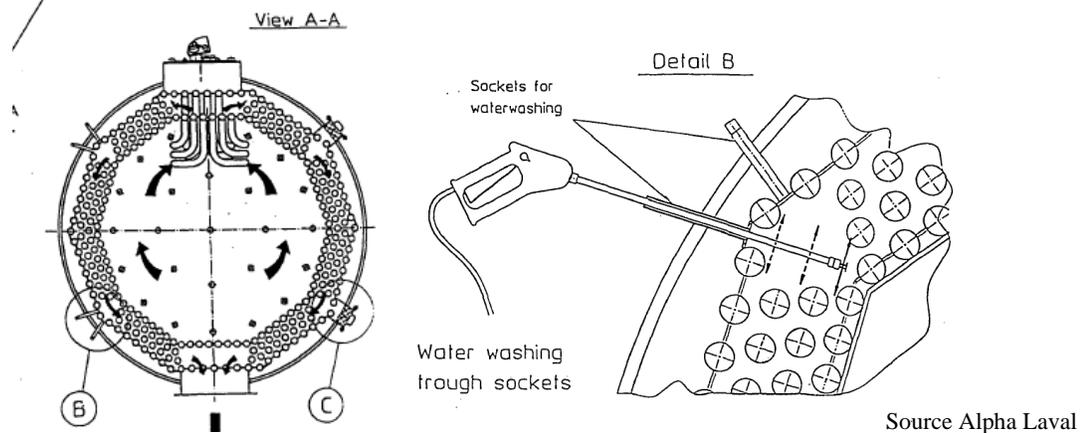

**Figure 2-5 Boiler tunnel setup: thermopile probe removed for sampling**

### **2.2.2 PM fouling discussion**

Sampling after a heat exchanging surfaces, like a boiler, can be a source for PM adsorption and desorption because these surfaces heat and cool in the presence of PM where thermophoretic loss/accumulation (Hind 2<sup>nd</sup> Edition 1999) can be significant. During boiler-on conditions, the hot

boiler exhaust gas heats the cool boiler tubes and PM can adsorb on the surfaces. As the tube surfaces can get hot, PM may start to desorb. Then, during periods of boiler-off condition (reduced water heating), the heat exchanger surfaces will cool until the next cycle. The adsorption and desorption of PM on a boiler surface can be described by thermophoretic loss models in Hind (2<sup>nd</sup> Edition 1999). When PM is adsorbed onto the surface, stack PM emission factors can be underestimated over short periods of time (measured in hours). This suggests the location for the sample probe is important to try and be before the surfaces and the condition of the boiler cleaning is important.

The boiler heat exchanger surfaces do include cleaning recommendations of the heat exchanger surfaces. According to the Aalborg manual, the boiler cleaning is performed by routine air blasts and occasional water blasts. The rate of cleaning varies with the quality of the fuel and the indications from the installed smoke meter. The water blasts are performed when boiler performance declines. There are several access ports for these water blast ports, see Figure 2-6. According to discussions with the crew the boiler was in a clean state, thus suitable for our emission testing.

**Figure 2-6 Cleaning setup for an Aalborg boiler**

### 2.2.3 Test protocol

The boiler load was operated for more than 30 minutes at the highest power possible to warm the engine and stabilize emissions. Repeats of the same load are performed prior to changing loads (i.e. mode 1, 1, 1 change load, mode 2, 2, 2 load change...). Based on experience testing OGVs, repeating test points with this approach is needed to manage the time it takes between different load points and to prevent issues when navigating in areas with speed restriction. For this testing, however, only one load point was performed so there were not conditions to wait for. In general, at each steady state test mode, the protocol requires the following:

- Allow the gaseous emissions to stabilize before measurement at each test mode (minimum 10 minutes as per ISO). This was possible on the ME and AE tests, but due to strict time constraints on the boiler this guide was not followed, but emissions were stable regardless.
- Measure gaseous and PM concentrations for at least 3 minutes and no longer than 30 minutes (such that approximately 500 $\mu$ g of filter mass is collected at a minimum dilution ratio of 4:1). For the boiler tests the filter weights averaged 100  $\mu$ g even with long sampling times of 40 minutes.

- Measure direct stack exhaust mass flow rate via EPA Method 2. Additionally, UCR recorded the fuel consumption of the boiler using discussions with vessel crew.
- Calculate emission factors from the measured pollutant concentration data and calculated mass flow rates.

### 2.3 Measurements

Like other marine tests, the measurement of exhaust concentrations followed the CARB<sup>2</sup> and IMO<sup>3</sup> protocols, see Appendix A for an in-depth description of UCR’s marine sampling system. A dilution tunnel is connected directly to the exhaust stack without the need for a transfer line. The flow in the dilution system eliminates water condensation in the dilution tunnel and sampling systems and maintains the temperature of the diluted exhaust gas at <52°C before the filters.

An overview of UCR’s partial dilution system is shown in Figure 2-7. Raw exhaust gas is transferred from the exhaust pipe (EP) through a sampling probe (SP) and the transfer tube (TT) to a dilution tunnel (DT) due to the negative pressure created by the venturi (VN) in DT. The gas flow rate through the TT depends on the momentum exchange at the venturi zone and is therefore affected by the absolute temperature of the gas at the exit of TT. UCR’s marine testing is directly connected to the stack so to minimize PM losses. The dilution ratio targeted and verified for this testing project was 10:1 and the actual dilution ratio was 7:1.

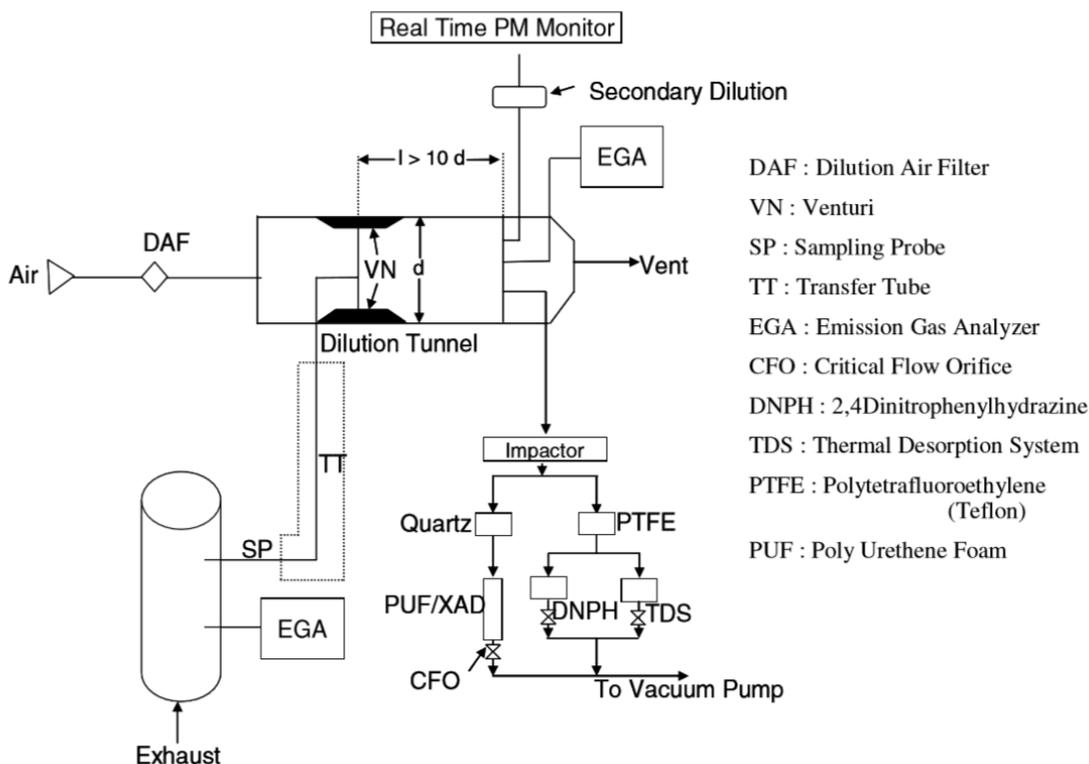

Figure 2-7 Sample schematic utilized

<sup>2</sup> California Air Resources Board, *Recommended Emissions Testing Guidelines for Ocean-going Vessels*, <https://www.arb.ca.gov/ports/marinevess/documents/emissionstest/OGV%20Test%20Guidelines.pdf>, (2012)

<sup>3</sup> ISO 8178-1 Reciprocating internal combustion engines - Exhaust emission measurement - Part 1: *Tested measurement of gaseous and particulate exhaust emissions*

<sup>1</sup> For this testing the TDS and PUF were not utilized and Suma canisters were collected from the secondary dilution system. Additionally, raw Suma canister grab samples were collected and analyzed.

ISO cautions that the advantages of partial flow dilution systems can be a source of sampling problems such as: losing particulates in the transfer tube, failing to take a representative sample from the engine exhaust and inaccurately determining the dilution ratio. UCR includes standard methods for each marine application to ensure these concerns are managed properly.

### 2.3.1 Gaseous and PM emissions

Best recommended practices for OGV exhaust gas measurements follow 40 CFR Part 1065 for PM measurements with specific details following ISO 8178-1 for dilution and exhaust gas sampling. The measurement approach is summarized here, with more details available in Appendix A.

**Gaseous:** The concentrations of gases in the diluted exhaust tunnel was measured with a Horiba PG-350. Nitrogen Oxides (NO<sub>x</sub>) utilize a heated chemiluminescence detector (HCLD), carbon monoxide (CO) and sulfur dioxide (SO<sub>2</sub>) utilize non-dispersive infrared absorption (NDIR) with cross flow modulation, and oxygen (O<sub>2</sub>) utilize a zirconium oxide sensor. Major features of the PG-350 include a built-in sample conditioning system (5 deg C) with sample pumps, data storage on a flash drive, integrated mist and particle filters, and a thermoelectric cooler. The performance of the PG-350 was tested and verified under the U.S. EPA and ETV programs.

Gaseous concentrations were measured directly from the dilution tunnel and from raw exhaust during dilution ratio verification. Dry-to-wet corrections were performed using calculated water concentration from the exhaust and the dilution tunnel.

**Table 2-2 Summary of Emissions Measured by UCR**

Species Sampled			
NDIR CO	NDIR CO <sub>2</sub>	CLD NO <sub>x</sub>	Photoacoustic eBC
NDIR SO <sub>2</sub>	Total PM <sub>2.5</sub> Gravimetric method	PM EC/OC NIOSH method	

**Particulate Matter (PM) mass:** UCR’s PM measurements use a partial flow dilution system that was developed based on the ISO 8178-1 protocol, detailed information is provided in Appendix A. Total PM mass less than 2.5 um diameter (PM<sub>2.5</sub>) is measured from the diluted exhaust gas according to the Code of Federal Regulations (CFR) 40 CFR Part 1065. UCR utilizes 47 mm 2um pore Teflon filters (Whatman Teflo) weighed offline with UCR’s UPX2 Mettler Toledo micro balance (0.1 ug resolution) in a temperature, humidity, and particle-controlled environment. The microbalance is operated following the weighing procedures of the CFR. Before and after collection, the filters are conditioned for a minimum of 24 hours in an environmentally controlled room (RH = 45%, T = 21 C, 9.5 C dew point) and weighed daily until two consecutive weight measurements were within 3µg.

**PM Composition:** The project measured PM composition which comprises elemental carbon (EC) and organic carbon (OC). OC/EC analysis was performed on samples collected on 2500 QAT-UP Tissuquartz Pall (Ann Arbor, MI) 47 mm filters that are preconditioned at 600°C for 5 h. A 1.5 cm<sup>2</sup> punch is cut out from the quartz filter and analyzed with a Sunset Laboratory (Forest Grove, OR) Thermal/Optical Carbon Aerosol Analyzer according to the NIOSH 5040 reference method. The PM composition filters were sampled from UCR dilution tunnel at a targeted flow rate of 15 slpm.

**Metals:** The metal analysis has not been performed at this time. It will be performed on the Teflon PM samples using X-Ray Fluorescence (XRF) from an offline analytical method. The filters were first weighed then will be sent out for XRF analysis. The method offers analysis of elements (Na through Pb) represented by 38 elements. XRF is an EPA approved, non-destructive analytical method (IO-3.3) wherein a filter is bombarded with X-ray energy. The subsequent excitement of electrons can be measured when the electrons fall back to their valence state, releasing energy in the process. Each element has a “fingerprint” of energy discharges which are measured to determine the quantity of each element.

**Equivalent black carbon (eBC).** Bond et al (2013) provided a definition of black carbon (BC) measurement methods as they relate to characterizing climate impacts. The photoacoustic measurement method is considered to be an equivalent BC method (denoted as eBC), the NIOSH thermal optical method is an apparent elemental carbon measure of BC (denoted as EC), single particle soot photometers such as the laser-induced incandescence measure the refractory nature of BC (denoted as rBC), and particle soot absorption photometers such as the Aethalometer and MAAAP instruments measure the equivalent BC (denoted as eBC). The instrument utilized for BC measurements in this study was UCR’s in-house photoacoustic real-time analyzer (AVL MSS-483) which represents the eBC measurement method as defined by Bond and is utilized here for consistency. The photoacoustic measurement method is a reliable and robust measurement for quantifying marine BC where the PM fractions vary significantly and have been shown to impact the EC measurement method (Bond et al 2013 and Johnson et al 2016). The photoacoustic measurement was sampled from the same dilution tunnel used for the gravimetric and NIOSH filter samples.

### **2.3.2 Toxics**

CARB utilizes speciation estimates from boiler emissions that are used in the emission inventory and air quality models. These models are lacking toxic data from marine boilers. As such, additional toxic samples were utilized for the boiler tests. These included aldehydes and ketones, speciated hydrocarbons, and metals. All the toxic samples were collected from the dilution tunnel as shown in Figure 2-7. Additionally, two speciated hydrocarbon samplers were collected directly from the raw stack to improve measurement sensitivity.

**Total Gaseous Non-Methane Organics (TGNMO)** concentrations are often measured using a total hydrocarbon analyzer with a field ionization detector (FID). However, these devices have a flame and are not usually allowed on a tanker vessel. For this project diluted exhaust samples were collected in SUMMA® canisters, equipped with flow controllers and subsequently analyzed for TGNMO at Atmospheric Analysis and Consulting (AAC) an off-site laboratory.

**PAMS** AAC also analyzed the SUMMA canisters for VOC's and BTX to process the total PAMS impact of the speciated HCs. They used the TO-12/PAMS method which provides the data for VOCs including light toxics (BTX and butadiene) and the PAMS profile needed for air quality modeling. With this method, the analysis provides concentrations of the following hydrocarbons.

Ethylene	3-Methylpentane	Styrene
Acetylene	1-Hexane	O-Xylene
Ethane	N-Hexane	N-Nonane
Propylene	Methylcyclopentane	Isopropylbenzene
Propane	2,4-Dimethylpentane	N-Propylbenzene
Isobutane	Benzene	M-Ethyltoluene
1-Butane	Cyclohexane	P-Ethyltoluene
N-Butane	2-Methylhexane	1,3,5-Trimethylbenzene
Trans-2-Butene	2,3-Dimethylpentane	O-Ethyltoluene
Cis-2-Butene	3-Methylhexane	1,2,4-Trimethylbenzene
Isopentane	2,2,4-Trimethylpentane	N-Decane
1-Pentane	N-Heptane	1,2,3-Trimethylbenzene
N-Pentane	Methylcyclohexane	M-Diethylbenzene
Isoprene	2,3,4-Trimethylpentane	P-Diethylbenzene
Trans-2-Pentene	Toluene	N-Undecane
Cis-2-Pentene	2-Methylheptane	N-Dodecane
2,2-Dimbutane	3-Methylheptane	
Cyclopentane	N-Octane	
2,3-Dimethylbutane	Ethylbenzene	
2-Methylpentane	M/P-Xylenes	

Note in the earlier tanker measurement project, VOC adsorbed molecules starting about C<sub>4</sub> (butadiene) through C<sub>12</sub> were collected on a multi-bed carbon bed composed of molecular sieve, activated charcoal, and carbotrap resin. The VOC included toxics such as 1,3 butadiene; benzene; toluene; ethylbenzene and xylenes. This method was not used during this testing campaign.

**Aldehydes and ketones:** Carbonyls (aldehydes and ketones) were collected on 2,4-dinitrophenylhydrazine (DNPH) coated silica cartridges (Waters Corp., Milford, MA) behind the Teflon filter. A critical flow orifice was used to control the 1.0 LPM flow through the cartridge. Sampled cartridges were sealed and stored at a cold temperature and later extracted using 5 mL of acetonitrile with the liquid then injected into Agilent 1100 series high performance liquid chromatograph (HPLC) equipped with a diode array detector. The HPLC column was similar to a 5µm Deltabond AK resolution (200cm x 4.6mm ID) with upstream guard column. The HPLC sample injection, and operating conditions are set up according to the specifications of the SAE 930142 HP protocol (Siegl, W et al 1993). The DNPH samples were collected from the dilution tunnel. Due to time limitations and sample difficulties only one valid sample was collected.

**Metals:** The metal analysis was performed on the Teflon PM samples using X-Ray Fluorescence (XRF) from an offline analytical method utilizing the same Teflon filters used to determine the

PM<sub>2.5</sub> mass. The filters were first weighed then sent out for XRF analysis. The method offers analysis of elements (Na through Pb) represented by 38 elements. XRF is an EPA approved, non-destructive analytical method (IO-3.3) wherein a filter is bombarded with X-ray energy. The subsequent excitation of electrons can be measured when the electrons fall back to their valence state, releasing energy in the process. Each element has a “fingerprint” of energy discharges which are measured to determine the quantity of each element.

### **2.3.3 Exhaust flow**

The calculated emission factor requires the measurement of the engines exhaust flow rate. The exhaust gas flow can be determined by the following methods:

1. Direct Measurement Method (**utilized**)
2. Carbon Balance Method (not available, lacking measured fuel consumption)
3. Air and Fuel Measurement Method (not available)
4. Air Pump method (not possible on boilers only engines)

Although there are four accepted methods for measuring flow rate, the direct measurement approach was most suitable for boiler testing. Direct exhaust flow measurement is complex and requires long straight sections which is not typically available on OGVs exhaust systems. Thus, direct measurement has not been a preferred method at UCR for engine exhaust flow, where fuel flow measurement has been utilized. For this boiler, there was a suitable straight section for good exhaust flow direct measurement. Thus, direct flow measurement (#1) was utilized for accurate emissions calculations.

The direct measurement system utilized in this project was a type S Pitot tube is used to measure the differential pressure between the counter-flow (static pressure) and parallel-flow (dynamic pressure) directions. This method follows EPA Method 2, see Section 2.4.2 and Appendix E for details.

### **2.3.4 Boiler**

The boiler output was not available for recording and only a single mode was utilized given the short time frame allowed on the vessel. The boiler was operated under normal usage conditions in a high load operation maintaining bulk fuel temperature. It is estimated based on the recorded fuel rate that the boiler load was around 65% of its total capacity.

## **2.4 Calculations**

The calculations are described in this section.

### **2.4.1 Emission factors**

The emissions were collected at the one mode in triplicate to allow for the determination of confidence intervals for the reported means. The triplicate measurements were performed by collecting three samples (i.e. triple or three repeated measurements) at each load point for all the species of interest (gaseous continuous and integrated PM samples). The result is based on the measured mass flow in the exhaust stack, the measured concentration of species, divided by the fuel rate calculated by the carbon balance method utilizing the MGO fuel as specified in Section 2.1.2. An overall single emission factor representing the boiler was determined by dividing the

integrated mass of emissions (g/hr) by the integrated fuel rate (kg-fuel/hr) to get an emission factor of g/kg-fuel for each species presented.

### 2.4.2 Exhaust flow

The exhaust flow calculation follows EPA Method 2 which utilizes a type S Pitot tube is used to measure the differential pressure between the counter-flow (static pressure) and parallel-flow (dynamic pressure) directions, see Figure 2-8. Velocity is calculated using Bernoulli's principle, which states that the pressure in a stream of fluid is reduced as the speed of the flow is increased. The velocity calculation is based off of the temperature, molecular weight of the exhaust gas, static pressure, dynamic pressure, and relative humidity. Measurement of the differential pressure and temperature were repeated at the sampling site several times at different depths inside the duct, including the near side of the duct, in the middle of the duct, and the far side of the duct, see Appendix E for detailed exhaust flow calculation.

Figure 2-8 S-type pitot tube for EPA Method 2

## 2.5 Corrections and assumptions

Ship testing is very complex where space and time are limited, and setup is from instruments which were transported in boxes to the test site and setup. As such, it is expected not everything will go according to plan, but most data on ships is of value since it is hard to come by.

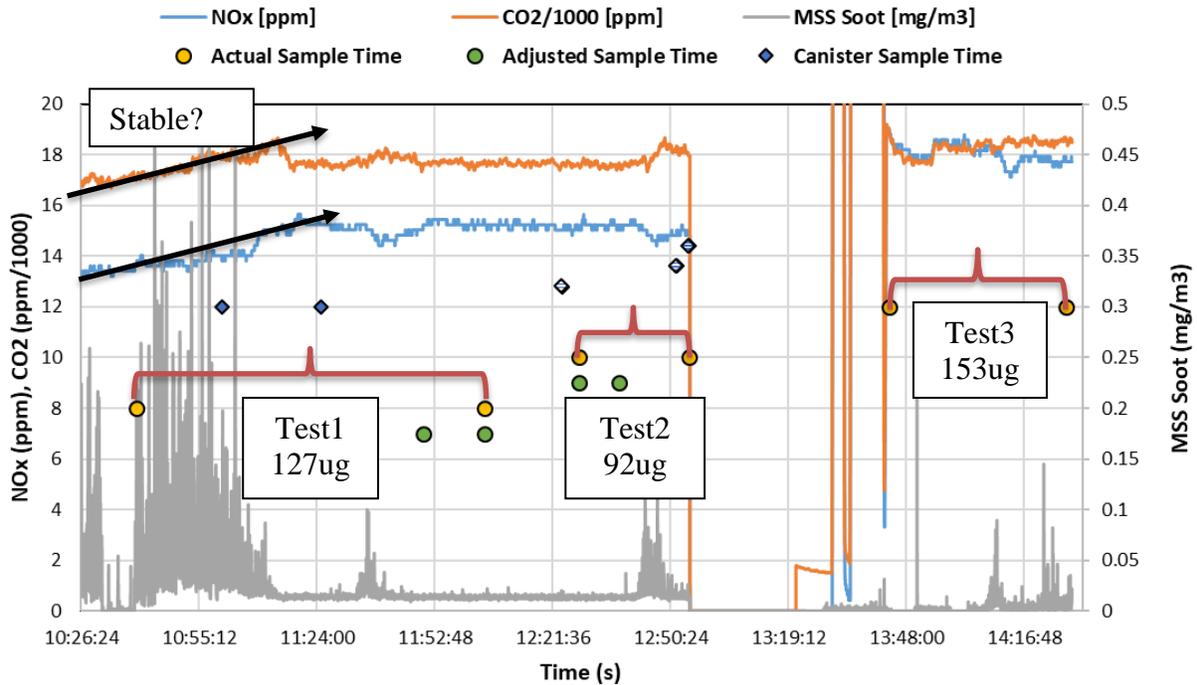

This section was added to discuss three issues that occurred while testing the boiler. These issues may impact the emissions where this section provides context to the quality of the reported data.

### 2.5.1 Emissions stability

There was a small stability issue that occurred at the start of sampling that may impact the gaseous emissions slightly and the eBC more significantly. The stability issue can be seen by the slight increase in CO<sub>2</sub> and NO<sub>x</sub> concentration for the first hour of testing, see Figure 2-9 between 10:30 and 11:30 (note this was after 1-2 hours of boiler stabilizing). The change in NO<sub>x</sub> concentration is small (1 ppm NO<sub>x</sub>) and larger for CO<sub>2</sub> (1.5% CO<sub>2</sub>), but the Test 1 MSS soot measurement (eBC) is five times higher than the steady state measured soot measurement of Test 2, see the grey trace in Figure 2-9. It is not clear what happened between 10:30 and 11:30, but it seems there was a slight change in fuel usage (CO<sub>2</sub> change) and unstable eBC emission (BC desorption, fueling, or other). There was also an impact in the PM filters as can be seen by the color of the

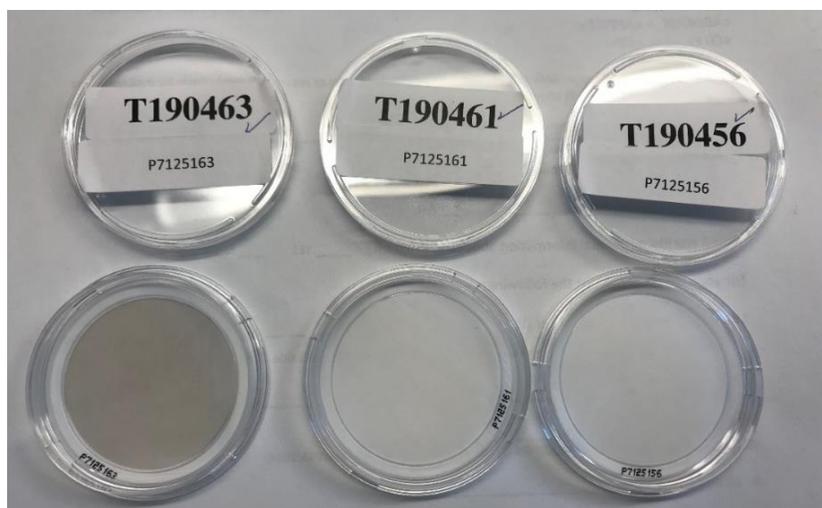

filters, see Figure 2-10. The first filter, Test #1, was darker than Test #2 and #3 supporting what was visible with the real time MSS soot sensor. The overall PM filter mass, however, did not change significantly, as discussed in the next sub section.

Previous testing on a container vessel modern boiler showed that soot concentration (eBC method) was very stable and averaged about 0.01 mg/m<sup>3</sup> during the 8 hours of sampling over three separate days. This would suggest the more representative eBC value is the one between 11:50 and 12:10 for test 1. As such, a re-analysis of the real time data was performed to collect the data for the stable time segment. A re-analysis of the gaseous emissions was also collected for this time period. The original sample durations are shown by orange circles and bars, the modified time segments are denoted by the green circles, see Figure 2-10. The results presented in this are based on the analysis during the green circles. The details of the original and modified data are provided in Appendix F.

**Figure 2-9 Real time emissions for tests 1, 2, and 3**

<sup>1</sup> Orange circles are the original sample times for PM filters, The blue triangles are the stop and stop of the SUMA canisters, green are the revised sample averaging times for the eBC and gaseous emissions.

**Figure 2-10 Sample filters Test 1, 2, and 3**

<sup>1</sup> The filter weights were 127, 153, and 92 ug from left to right.

### **2.5.2 Filter spotting**

During the dilution tunnel installation, the PM cyclone would not fit due to space limitations so it had to be removed, see discussion in Section 2.2.1. Cyclones were introduced into PM samplers to prevent collecting wall accumulated particles, debris in the exhaust, and other objects not emitting directly from the combustion process. Typically, a properly sampled PM filter would not show visible spotting. The spotting on these filters cannot be seen easily with-out some type of magnification, see Figure 2-10 vs Figure 2-11. The mass impact due to the spotting is believed to be small because less than 5% of the total mass is soot and the spotting would likely be soot based accumulation particles. Additionally, the PM mass for the darker filter is less than the PM mass for the other two filters showing that the color of the filter isn't what is causing the higher PM filter weights.

The results for the PM mass filters are presented “as is” where these values maybe be artificially high by 5% due to the filter # 1 eBC instability and the PM spotting. Also, these PM mass emission rates are similar to the recent boiler UCR tested on a container ship and these PM mass emission rates are much lower than a similar crude tanker tested in 2008 (Agrawal et al 2008), so the data is of value to report.

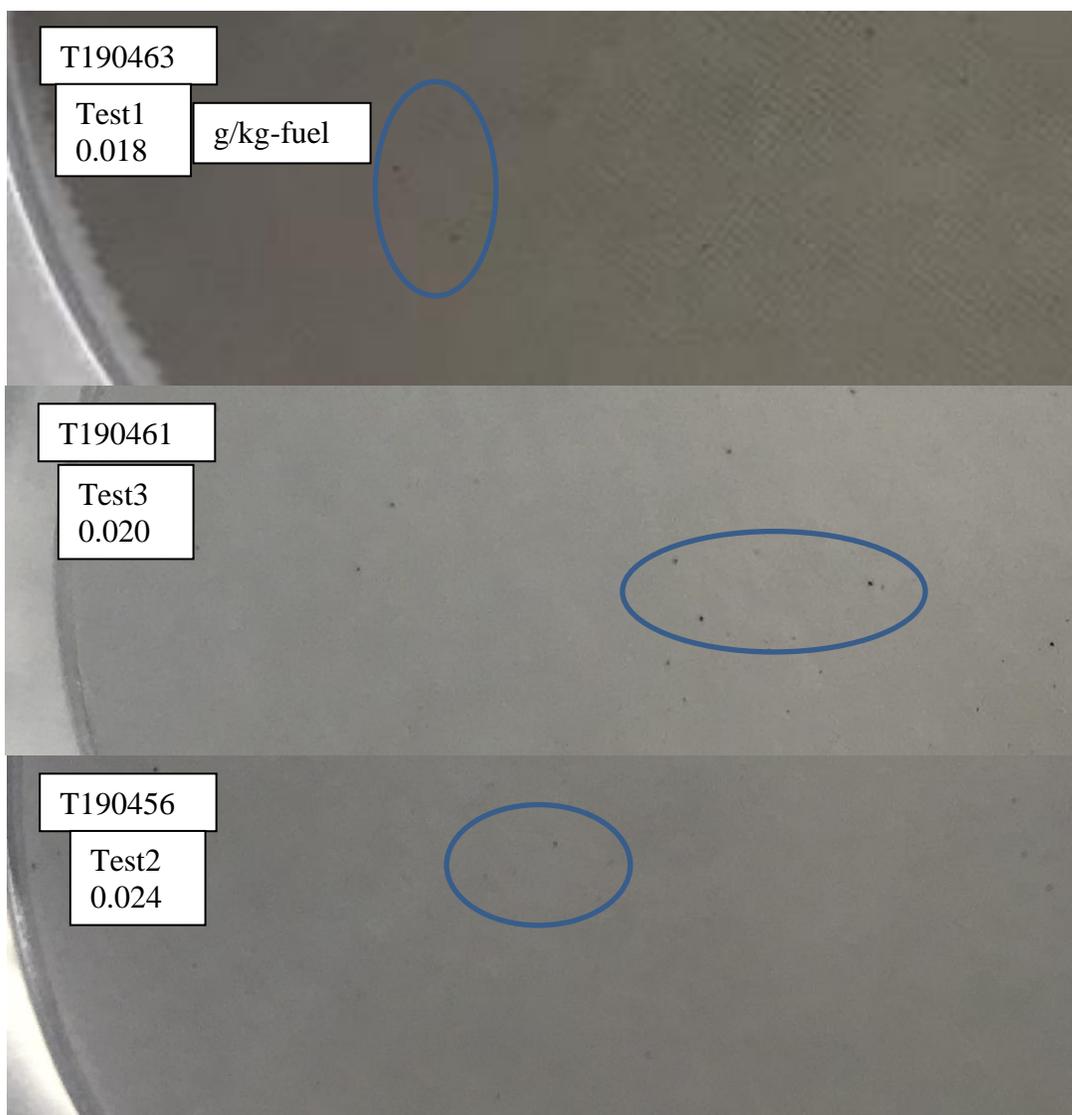

Figure 2-11 Filter spotting for tests 1, 2, and 3 (most observed spotting)

### 2.5.3 Toxics

SUMA canisters samplers were collected from the dilution tunnel between 11:01 and 12:24 and from the raw exhaust after 12:50, see Table 2-3. The dilute samples resulted in detectable quantities of C2-C4 analytes, but for the raw, undiluted samples, all the analyte responses below C5 were below the Sample Reporting Limit (SRL), see Table 2-4. The EPA 3C analysis showed 1.5% CO<sub>2</sub> in the dilute measurement and 10.5% CO<sub>2</sub> in the raw stack sample, suggesting the samplers were labeled and analyzed correctly. This suggests there may be a contamination in the dilution air utilized for the dilute BTEX samples.

The raw samples were used in the report analysis and this finding doesn't impact to overall discussion. Future BTEX samples will consider this impact on our sampling system especially when testing for lighter HC fuels.

**Table 2-3 Summary of BETX sampling locations**

BTEX				
Start Time	Dur	Flow	ID	Comment
hh:mm	min	slpm		
11:01	24	0.5	BTX6123	Dil tunnel
12:24	28	0.5	BTX6121	Dil tunnel
12:52	3	-	BTX6124	Raw stack grab
12:55	3	-	BTX6126	Raw stack grab

**Table 2-4 Summary of BTEX concentrations C2-C4 dilute vs stack discussion**

Analyte	MM		Diulte		Stack	
			#1	#2	#3	#4

### 3 Results

The emission results for the Alfa Laval auxiliary boiler installed on a tanker are described in this section. The results are based on the operation of the boiler under in-use conditions during fuel off-load in a Northern California port. The estimated load condition is 65%. There were some data corrections performed and these corrections are explained in Section 2.5. This section presents the results of the final data set, where all data points are available in Appendix F.

The result section is divided into three sub sections gaseous, PM (PM mass and composition and BC), and toxics. All error bars and standard deviations (stdev) presented are based on one sigma ( $\sigma$ ) uncertainty.

#### 3.1 Gaseous

The gaseous emissions include NO<sub>x</sub>, CO, CO<sub>2</sub>, and SO<sub>2</sub>. The SO<sub>2</sub> emissions were both measured and calculated where the calculated values are used in this report. The gaseous emissions are shown in Table 3-1 (averages), Table 3-3 (stdev) and Figure 3-1. The boiler fsCO<sub>2</sub> emissions were 3026 g/kg-fuel. This is similar (with-in 2%) to previous testing of a modern auxiliary boiler on a container vessel. The close agreement suggests both boiler tests were performed under similar conditions.

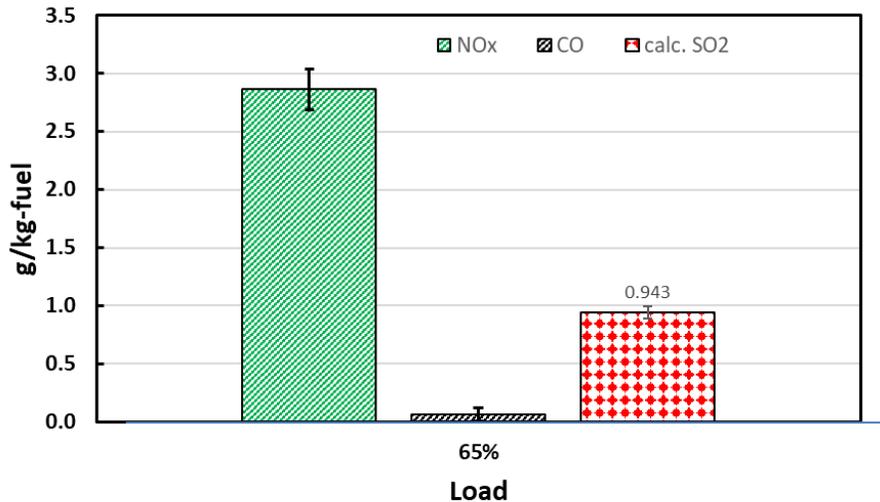

The fuel specific (fs) NO<sub>x</sub> emissions averaged  $2.86 \pm 0.18$ , CO  $0.06 \pm 0.064$ , and SO<sub>2</sub> 0.94 g/kg-fuel. The fsNO<sub>x</sub> emissions were slightly higher, with-in 50%, to previous testing of a modern container vessel auxiliary boiler tested on low sulfur MGO and ULSFO fuels (0.038 S and 0.089 S respectively) (Johnson et al 2019), but over two times lower (2.2) than the emissions on a tanker vessel auxiliary boiler tested on high sulfur HFO fuel (2.85% S) (Agrawal et al 2008). The CO emissions were 6.9 times lower than the boiler operating on HFO fuel. The boiler SO<sub>2</sub> emissions were lower for the low sulfur fuel compared to a high sulfur HFO fuels, lower by a factor of 58 (Agrawal et al 2008). The main difference is a result of the sulfur weight fraction in the fuel.

**Table 3-1 Summary of Emissions Measured by UCR (ave)**

Boiler Load	Carb. FC kg/hr	Units	Average Species					
			NOx	CO	CO2	calc. SO2	PM2.5	PM_eBC
65%	2460.4	g/hr	7051.0	154.7	7445560	2321.0	53.7	2.9
65%	2460.4	g/kg-fuel	2.86	0.064	3026.1	0.943	0.022	0.0012

**Table 3-2 Summary of Emissions Measured by UCR (stdev)**

Boiler Load	Carb. FC kg/hr	Units	Stdev Species					
			NOx	CO	CO2	calc. SO2	PM2.5	PM_eBC
65%	2460.410	g/hr	0.261	0.063	0.434	0.000	0.004	0.0028
65%	2460.410	g/kg-fuel	0.175	0.055	0.162	0.050	0.004	0.0004

**Figure 3-1 NOx, CO, and SO2 boiler emissions (g/kg-fuel)**

<sup>1</sup> SO2 is calculated from sulfur in the fuel and fuel usage.

### 3.2 PM

The PM emissions are organized by PM mass, PM composition (EC, OC, Sulfate), and equivalent BC (eBC), see Section 2.3 for a description of the PM measurement method and definitions.

The PM<sub>2.5</sub> mass and eBC emissions for the boiler are shown in Table 3-1 and Figure 3-2. The average PM<sub>2.5</sub> emissions were  $0.022 \pm 0.004$  g/kg-fuel and the eBC emissions were  $0.0012 \pm 0.0004$  g/kg-fuel. The PM<sub>2.5</sub> emissions were slightly lower, within 50%, to previous testing of a modern auxiliary boiler tested on low sulfur MGO and ULSFO fuels (Johnson et al 2019), but over 100 times lower (131) than the PM emissions on a boiler tested on high sulfur HFO fuel, (Agrawal et al 2008).

The boiler eBC emissions were higher (70%) than the previous testing of a modern boiler (Johnson et al 2018), but the soot concentration in the stack was similar and near the detection limits of the measurement method. This suggests the difference between the eBC emissions from the two modern boilers may be a result of detection limits. eBC emissions were not measured with a micro soot sensor during the 2008 tanker testing, but NIOSH EC mass was measured. The boiler eBC emissions was 120 times lower than the EC emission reported for the tanker operating on high sulfur fuels (Agrawal et al 2008). Johnson has shown the EC measurement method at ratios of EC/OC < 5%, like in Agrawal’s study, are less accurate (Johnson et al 2016), thus it is not clear the benefit of the eBC or EC measurement difference between the modern and older boilers.

The speciated PM (EC, OC, and Sulfate) emissions are shown in Table 3-3 and Figure 3-2. The PM<sub>EC</sub> was 0.56 mg/kg-fuel and the OC<sub>PM</sub> was 21 mg/kg-fuel. The fraction of EC compared to the sum of EC+OC is 2.2% suggesting the EC fraction is low for the boiler emissions and OC fractions are larger. The sulfate PM is still being analyzed, but can be estimated from the fuel sulfur level. This is estimated at 11 mg/kg-fuel for a fuel sulfur level of 0.0483%. With the estimated sulfur the PM composition is calculated to be approximately 68.5% organic, 30% sulfate, and 1.5% elemental.

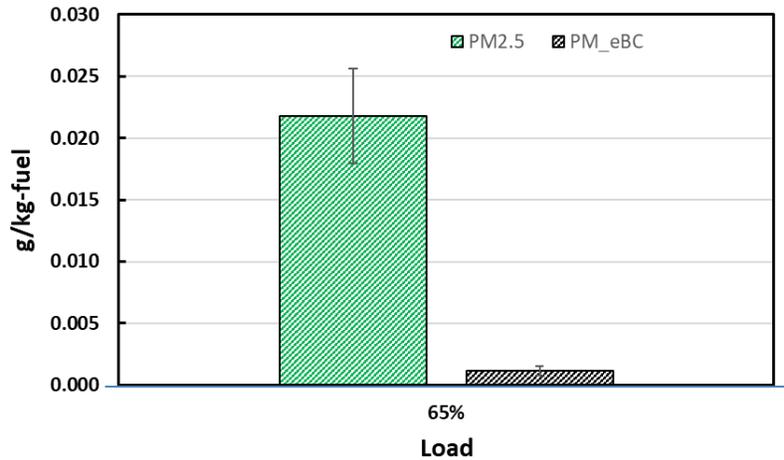

**Table 3-3 Summary of PM composition measured by UCR (ave)**

Boiler Load	Carb. FC kg/hr	Units	Average Species					
			PM_EC	PM_OC	PM_S	PM_TC	PM_OCcor	PM_TCcor
65%	2460.4	g/hr	1.400	51.218	-	79.356	61.461	89.599
65%	2460.4	g/kg-fuel	0.00056	0.021	-	0.032	0.025	0.036

<sup>1</sup> PM\_S is represented as hydrated sulfate ions (H<sub>2</sub>SO<sub>4</sub>·6.55H<sub>2</sub>O), PM\_TC is the sum of PM\_EC+PM\_OC+PM\_S, PM\_OCcor = 1.2\*PM\_OC to correct for the hydrogen bonding estimate, and PM\_TCcor = PM\_EC+PM\_OCcor+PM\_S and should represent the total PM mass and, thus, be comparable to PM<sub>2.5</sub>

**Table 3-4 Summary of of PM composition measured by UCR (stdev)**

Boiler Load	Carb. FC kg/hr	Units	Stdev Species					
			PM_EC	PM_OC	PM_S	PM_TC	PM_OCcor	PM_TCcor
65%	2460.4	g/hr	0.001	0.007	-	0.006	0.008	0.008
65%	2460.4	g/kg-fuel	0.00032	0.004	-	0.003	0.004	0.004

**Figure 3-2 PM<sub>2.5</sub> and eBC emissions (g/kg fuel)**

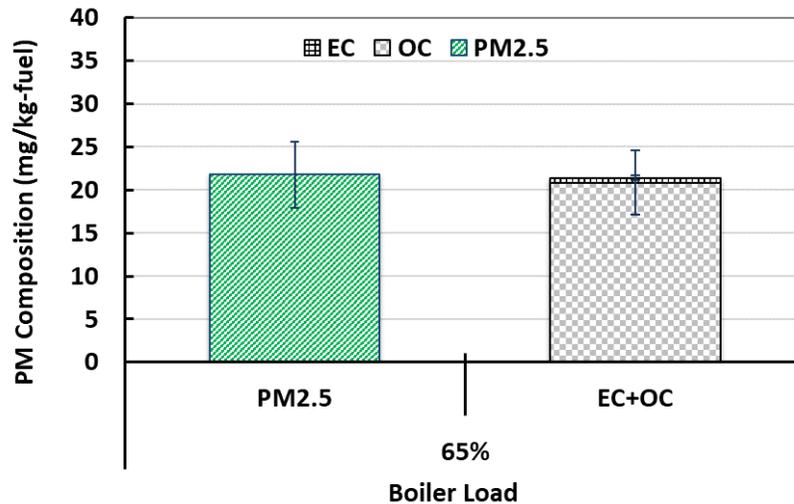

Figure 3-3 PM<sub>2.5</sub> and eBC emissions (mg/kg fuel)

### 3.3 Toxics

Toxics measurements were collected for the boiler tests. These include aldehydes and ketones, speciated hydrocarbons, and metals.

**Aldehydes and ketones:** The aldehydes and ketones are presented in Table 3-5. Only Formaldehyde, Acetaldehyde and Acrolein were analyzed, other species were not reported. The boiler emissions for Formaldehyde, Acetaldehyde and Acrolein were 0.401, 0.376, and 1.749 mg/kg-fuel. These results compare well with the modern boiler operating on MGO fuel from a container vessel. Both modern boilers operating on MGO fuel (container and tanker) emission results showed lower Formaldehyde emissions compared to the container boiler emissions when operating on low sulfur HFO fuel. Additionally, modern boilers operating on MGO fuels appear to have lower Acetaldehyde and Acetone emissions compared to the boiler tested by Agrawal (Agrawal et al 2008).

Table 3-5 Average Aldehydes and ketone emissions by fuel by test load.

Fuel	Load	Fuel Use kg/hr	Units	Formaldehyde	Acetaldehyde	Acrolein
MGO	65%	2460	mg/hr	976.6 ± -	917.0 ± -	4263.1 ± -
MGO	65%	2460	mg/kg-fuel	0.401 ± -	0.376 ± -	1.749 ± -

<sup>1</sup> Statistical student t.test was not performed due to only one sample collected. Expected uncertainty from other replicate tests from boilers is ± 15%.

**BTEX speciated hydrocarbons:** The total PAMS, TNMHC, and selected species are presented in Table 3-6. The total PAMS were low and just above the Sample Report Limit (SRL) at 2 ppb and the total NMHC were 249 ppb on average. On a mass basis, the total PAMS and TNMHC were 0.0033 and 0.516 mg/kg-fuel, see Table 3-7. Other selected speciated HCs (C4-C8) are shown in Table 3-7 which were all below the SRL where the values reported represent an upper limit to their measurement this is why they are reported with the “<” sign. The speciated HCs (C4-C8) are higher during this modern boiler test compared to those reported by Agrawal (Agrawal et al 2008). One reason for the higher emissions in this testing may be due to different

sample detection limits between the laboratories. The full report of speciated HCs (C2-C12) is provided in Appendix F. Also, during the previous study, PAHs were collected which were not collected in this study so that comparison is not available.

**Table 3-6 EPA 3C, total PAMS, and TNMHC results, raw stack**

Analyte	Stack EPA 3C		
	#1	#2	Ave
Dilution Factor	1.97	1.79	1.88
H2	<2.0%	<1.8%	<1.8%
Ar/O2	7.5%	7.5%	7.5%

## 4 Summary

Emissions measurements were made on from a modern auxiliary boiler on a tanker ship while it offloads fuel with-in a port in Northern California where the main engine was off. The auxiliary boiler was operated on MGO fuel and operated at an estimated 65% load. Emissions were measured following ISO and CFR methods for gaseous, and PM (total mass, elemental, and organic carbon species, sulfated PM). Boiler sampling also include toxics to help the CARB update its boiler emissions inventory. Dilution ratios and filter temperatures, as specified in 1065, were met during this testing.

A summary of the results for the testing is as follows:

- The emissions were slightly unstable at the start of testing, but were found to be stable for the segments analyzed. The reported data set is representative of valid measurements suggesting the results are representative of a properly operating boiler.
- The boiler fuel flow rate was measured at 2460 kg/hr utilizing direct measurement of exhaust flow and carbon balance from emissions species. This agrees well with the reported fuel rate that ranged from 2268 to 2722 kg/hr according to the Chief. The corresponding exhaust flow at the 2460 kg/hr fuel rate was 35,639 m<sup>3</sup>/hr.
- The boiler fuel specific (fs) CO<sub>2</sub> emissions were 3026 g/kg-fuel. This is similar to previous testing of a modern auxiliary boiler on a container vessel.
- The boiler fsNO<sub>x</sub> emissions averaged 2.86 ± 0.18, CO 0.06 ± 0.064, and SO<sub>2</sub> 0.94 g/kg-fuel. The fsNO<sub>x</sub> emissions were slightly higher, with-in 50%, to previous testing of a modern container vessel auxiliary boiler tested on low sulfur MGO and ULSFO fuels, but over two times lower (2.2) than the emissions on a tanker vessel auxiliary boiler tested on high sulfur HFO fuel. The CO emissions were 6.9 times lower than the boiler operating on HFO fuel.
- The boiler fsSO<sub>2</sub> emissions were lower for the low sulfur fuel compared to a high sulfur HFO fuels by a factor of 58
- fsPM<sub>2.5</sub> emissions were 0.022 ± 0.004 g/kg-fuel and were slightly lower to previous testing of a modern auxiliary boiler tested on low sulfur MGO and ULSFO fuels, but over 100 times lower (131) than the PM emissions on a boiler tested on high sulfur HFO fuel. The main difference between boiler PM emissions on low and high sulfur fuels is the sulfur content of the fuel.
- The fs\_eBC emissions were 0.0012±0.0004 g/kg-fuel and were about the same for a previous modern boiler tested, but about 120 times lower than the fsEC emission reported for an older boiler tested on a tanker. The methods were not the same and there may be questions for this large difference.
- The fsPM composition (EC, OC, and Sulfate) were 0.56, 21, and 11 mg/kg-fuel respectively. The sulfute PM emissions were calculated and will be updated with measured values once the state shut down has been lifted.
- The metals emissions were... Waiting on the analysis due to the state shut down.

- The boiler emissions for Formaldehyde, Acetaldehyde and Acrolein were 0.401, 0.376, and 1.749 mg/kg-fuel. These results compare well with the modern boiler operating on MGO fuel test from a container vessel. Modern boilers operating on MGO fuels appear to have lower Acetaldehyde and Acetone emissions compared to older boiler tested on HFO fuels.
- The total speciated HCs (C2-C12) PAMS and TNMHC were 0.0033 and 0.516 mg/kg-fuel. The PAMS measurements were at the detection limit of the measurement method and thus, could not be compared properly to the previous testing on an older boiler tested on a high sulfur HFO fuel.

## Appendix A – Sample Collection Methods

ISO 8178-1<sup>4</sup> and ISO 8178-2<sup>5</sup> specify the measurement and evaluation methods for gaseous and particulate exhaust emissions when combined with combinations of engine load and speed provided in ISO 8178- 4: *Test cycles for different engine applications*. The emission results represent the mass rate of emissions per unit of work accomplished. Specific emission factors are based on brake power measured at the crankshaft, the engine being equipped only with the standard auxiliaries necessary for its operation. Per ISO, auxiliary losses are <5 % of the maximum observed power. IMO ship pollution rules and measurement methods are contained in the “International Convention on the Prevention of Pollution from Ships”, known as MARPOL 73/78<sup>6</sup>, and sets limits on NO<sub>x</sub> and SO<sub>x</sub> emissions from ship exhausts. The intent of this protocol was to conform as closely as practical to both the ISO and IMO standards.

### Gaseous and Particulate Emissions

A properly designed sampling system is essential for accurate collection of a representative sample from the exhaust and subsequent analysis. ISO points out that particulate must be collected in either a full flow or partial flow dilution system and UCR chose the partial flow dilution system as shown in Figure A-1.

**Figure A-1 Partial Flow Dilution System**

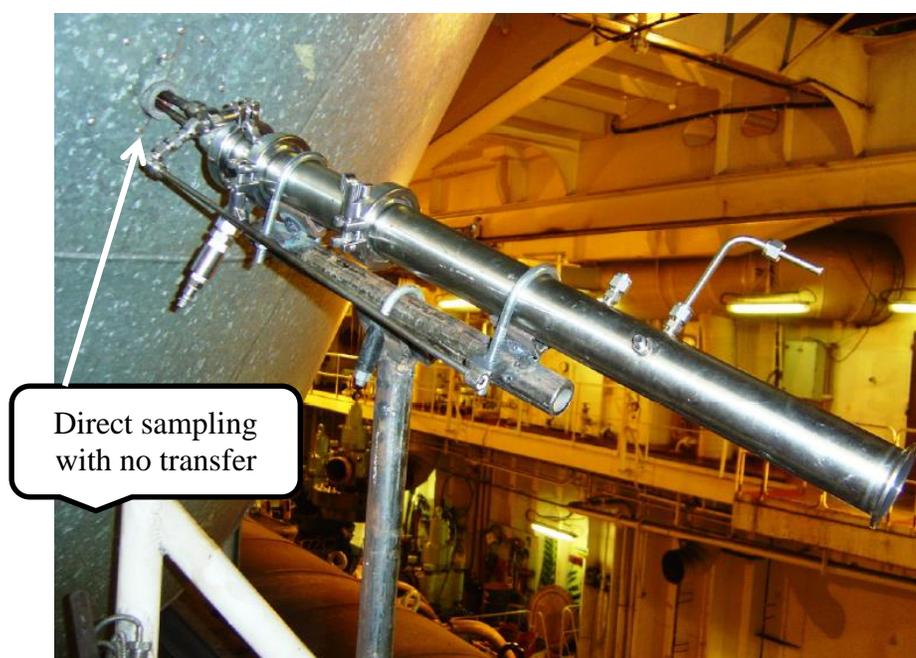

<sup>4</sup> International Standards Organization, ISO 8178-1, *Reciprocating internal combustion engines - Exhaust emission measurement -Part 1: Test-bed measurement of gaseous particulate exhaust emissions*, First edition 1996-08-15

<sup>5</sup> International Standards Organization, ISO 8178-2, *Reciprocating internal combustion engines - Exhaust emission measurement -Part 2: Measurement of gaseous and particulate exhaust emissions at site*, First edition 1996-08-15

<sup>6</sup> International Maritime Organization, *Annex VI of MARPOL 73/78 “Regulations for the Prevention of Air Pollution from Ships and NO<sub>x</sub> Technical Code”*.

The flow in the dilution system eliminates water condensation in the dilution tunnel and sampling systems and maintains the temperature of the diluted exhaust gas at  $<52^{\circ}\text{C}$  before the filters. ISO cautions that the advantages of partial flow dilution systems can be lost to potential problems such as: losing particulates in the transfer tube, failing to take a representative sample from the engine exhaust and inaccurately determining the dilution ratio.

An overview of UCR's partial dilution system is shown in Figure A-1. Raw exhaust gas is transferred from the exhaust pipe (EP) through a sampling probe (SP) and the transfer tube (TT) to a dilution tunnel (DT) due to the negative pressure created by the venturi (VN) in DT. The gas flow rate through TT depends on the momentum exchange at the venturi zone and is therefore affected by the absolute temperature of the gas at the exit of TT. Consequently, the exhaust split for a given tunnel flow rate is not constant, and the dilution ratio at low load is slightly lower than at high load. More detail on the key components is provided in Table A-1.

**Figure A-2 measurement layout on an engine exhaust stack**

### **Dilution Air System**

40 CFR Part 1065 recommends dilution air to be  $20$  to  $30^{\circ}\text{C}$  and ISO recommends  $25 \pm 5^{\circ}\text{C}$ . Both also recommend using filtered and charcoal scrubbed air to eliminate background hydrocarbons. The dilution air may be dehumidified. The system can be described as follows: The pressure is reduced to around 40 psig, a liquid knock-out vessel, desiccant to remove moisture with silica gel containing an indicator, hydrocarbon removal with activated charcoal, and a HEPA filter for the fine aerosols that might be present in the supply air. The silica gel and activated carbon are changed for each field campaign. Figure A-3 shows the field processing unit in its transport case. In the field the case is used as a framework for supporting the unit.

**Table A-1 Components of a Sampling System: ISO Criteria & UCR Design**

Section	Selected ISO and IMO Criteria	UCR Design
Exhaust Pipe (EP)	In the sampling section, the gas velocity is > 10 m/s, except at idle, and bends are minimized to reduce inertial deposition of PM. Sample collection of 10 pipe diameters of straight pipe upstream is recommended and performed where possible. For some tight configurations use good engineering judgment.	UCR follows the ISO recommendation, when practical.
Sampling Probe (SP) -	The minimum inside diameter is 4 mm and the probe is an open tube facing upstream on the exhaust pipe centerline. No IMO code.	UCR uses a stainless steel tube with diameter of 8mm placed near the center line.
Transfer Tube (TT)	<ul style="list-style-type: none"> <li>• As short as possible and &lt; 5 m in length;</li> <li>• Equal to/greater than probe diameter &amp; &lt; 25 mm diameter;</li> <li>• TTs insulated. For TTs &gt; 1m, heat wall temperature to a minimum of 250°C or set for &lt; 5% thermophoretic losses of PM.</li> </ul>	UCR uses a transfer tube of 0.15 m (6 inches). Additionally the sample tube insertion length varies with stack diameter, but typically penetrates at least 10%, but not more than 50% of the stack diameter.
Dilution Tunnel (DT)	<ul style="list-style-type: none"> <li>• shall be of a sufficient length to cause complete mixing of the exhaust and dilution air under turbulent flow conditions;</li> <li>• shall be at least 75 mm inside diameter (ID) for the fractional sampling type, constructed of stainless steel with a thickness of &gt; 1.5 mm.</li> </ul>	UCR uses fractional sampling; stainless steel tunnel has an ID of 50mm and thickness of 1.5mm.
Venturi (VN) --	The pressure drop across the venturi in the DT creates suction at the exit of the transfer tube TT and the gas flow rate through TT is basically proportional to the flow rate of the dilution air and pressure drop.	Venturi proprietary design provided by MAN B&W; provides turbulent mixing.
Exhaust Gas Analyzers (EGA)	One or several analyzers may be used to determine the concentrations. Calibration and accuracy for the analyzers are like those for measuring the gaseous emissions.	UCR uses a 5-gas analyzer meeting IMO/ISO specs

**Figure A-3 Field Processing Unit for Purifying Dilution Air in Carrying Case**

### **Calculating the Dilution Ratio**

According to ISO 8178, “it is essential that the dilution ratio be determined very accurately” for a partial flow dilution system such as what UCR uses. The dilution ratio is simply calculated from measured gas concentrations of CO<sub>2</sub> and/or NO<sub>x</sub> in the raw exhaust gas, the diluted exhaust gas and the dilution air. UCR has found it useful to independently determine the dilution ratio from both CO<sub>2</sub> and NO<sub>x</sub> and compare the values to ensure that they are within ±10%. UCR’s experience indicates the independently determined dilution ratios are usually within 5%. At systematic deviations within this range, the measured dilution ratio can be corrected, using the calculated dilution ratio. According to ISO, dilution air is set to obtain a maximum filter face temperature of <52°C and the dilution ratio shall be > 4.

### **Dilution System Integrity Check**

ISO describes the necessity of measuring all flows accurately with traceable methods and provides a path and metric to quantifying the leakage in the analyzer circuits. UCR has adopted the leakage test and its metrics as a check for the dilution system. According to ISO the maximum allowable leakage rate on the vacuum side shall be 0.5 % of the in-use flow rate for the portion of the system being checked. Such a low leakage rate allows confidence in the integrity of the partial flow system and its dilution tunnel. Experience has taught UCR that the flow rate selected should be the lowest rate in the system under test.

### **Measuring the Gaseous Emissions: CO, CO<sub>2</sub>, NO<sub>x</sub>, O<sub>2</sub>, SO<sub>2</sub>**

Measurement of the concentration of the main gaseous constituents is one of the key activities in measuring emission factors. This section covers the ISO/IMO protocols used by UCR. For SO<sub>2</sub>, ISO/CFR recommends that the concentration of SO<sub>2</sub> is calculated based on the fact that 97.75% of the fuel sulfur is converted to SO<sub>2</sub> (40 CFR Part 1065). UCR agrees with this recommendation and the enclosed SO<sub>2</sub> reported emissions are calculated from fuel sulfur levels.

## Measuring Gaseous Emissions: ISO & IMO Criteria

ISO specifies that either one or two sampling probes located in close proximity in the raw gas can be used and the sample split for different analyzers. However, in no case can condensation of exhaust components, including water and sulfuric acid, occur at any point of the analytical system. ISO specifies the analytical instruments for determining the gaseous concentration in either raw or diluted exhaust gases.

- Non-dispersive infrared analyzer (NDIR) for the measurement of carbon monoxide and carbon dioxide;
- Heated chemiluminescent detector (HCLD) or equivalent for measurement of nitrogen oxides;
- Paramagnetic detector (PMD) or equivalent for measurement of oxygen.

ISO states the range of the analyzers shall accurately cover the anticipated concentration of the gases and recorded values between 15% and 100% of full scale. A calibration curve with five points is specified. However, with modern electronic recording devices, like a computer, ISO allows the range to be expanded with additional calibrations. ISO details instructions for establishing a calibration curve below 15%. In general, calibration curves must be  $< \pm 2\%$  of each calibration point and be  $< \pm 1\%$  of full scale zero.

ISO outlines their verification method. Each operating range is checked prior to analysis by using a zero gas and a span gas whose nominal value is more than 80 % of full scale of the measuring range. If, for the two points considered, the value found does not differ by more than  $\pm 4\%$  of full scale from the declared reference value, the adjustment parameters may be modified. If  $>4\%$ , a new calibration curve is needed.

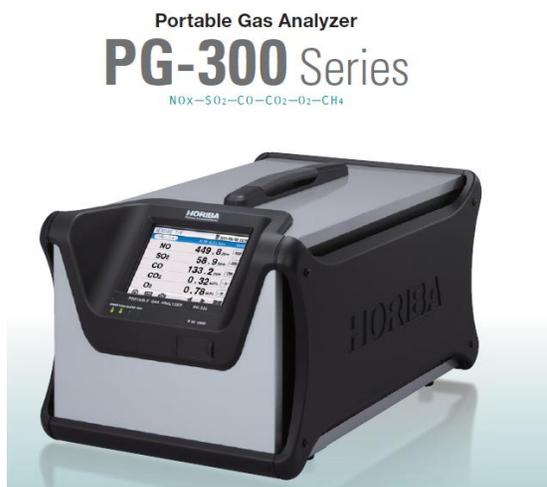

ISO, IMO, and CFR specify the operation of the HCLD. The efficiency of the converter used for the conversion of  $\text{NO}_2$  into  $\text{NO}$  is tested prior to each calibration of the  $\text{NO}_x$  analyzer. 40 CFR Part 1065 requires 95% and recommends 98%. The efficiency of the converter shall be  $>95\%$  and will be evaluated prior to testing.

ISO requires measurement of the effects of exhaust gases on the measured values of  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{NO}_x$ , and  $\text{O}_2$ . Interference can either be positive or negative. Positive interference occurs in NDIR and PMD instruments where the interfering gas gives rise to the same effect as the gas being measured, but to a lesser degree. Negative interference occurs in NDIR instruments due to the interfering gas broadening the absorption band of the measured gas, and in HCLD instruments due to the interfering gas quenching the radiation. Interference checks are recommended prior to an analyzer's initial use and after major service intervals.

## Measuring Gaseous Emissions: UCR Design

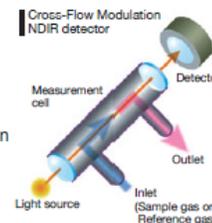

The concentrations of  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{NO}_x$  and  $\text{O}_2$  in the raw exhaust and in the dilution tunnel are measured with a Horiba PG-250 portable multi-gas analyzer. The PG-250 simultaneously measures five separate gas components with methods recommended by the ISO/IMO and USEPA. The signal output of the instrument is connected to a laptop computer through an RS-232C interface to continuously record measured values. Major features include a built-in sample

conditioning system with sample pump, filters, and a thermoelectric cooler. The performance of the PG-250 was tested and verified under the U.S. EPA ETV program.

**Cross-Flow Modulation advanced efficiency of NDIR analysis**

In PG-300, Cross-Flow Modulation is newly applied to SO<sub>2</sub>, CO, and new CH<sub>4</sub> analyzers. With Cross-Flow Modulation NDIR method, sample gas and reference gas flow into a single measurement cell switching one by one, and it brings about advantages that no optical adjustment is required, the zero point is kept stable, and the sample cell remains clean and it reduces span drift. The equipments will be kept safe for a long time as well. Cross-Flow Modulation Chemiluminescence detection method is already introduced for NO<sub>x</sub> analyzer in previous model and has the same effects as aforesaid analyzers.

**Figure A-4 Gas analyzer setup with measurement cell description**

Details of the gases and the ranges for the Horiba instrument are shown in Table A-2. Note that the Horiba instrument measures sulfur oxides (SO<sub>2</sub>); however, UCR follows the protocol in ISO which recommends calculation of the SO<sub>2</sub> level from the sulfur content of the fuel as the direct measurement for SO<sub>2</sub> is less precise than calculation. When an exhaust gas scrubber is present, UCR recommends measuring the SO<sub>2</sub> concentration after the scrubber since the fuel calculation approach will not be accurate due to scrubber SO<sub>2</sub> removal performance expectations.

**Table A-2 Detector Method and Concentration Ranges for Monitor**

Component	Detector	Ranges
Nitrogen Oxides (NO <sub>x</sub> )	Heated Chemiluminescence Detector (HCLD)	0-25, 50, 100, 250, 500, 1000, & 2500 ppmv
Carbon Monoxide (CO)	Non dispersive Infrared Absorption (NDIR). Cross flow modulation	0-200, 500, 1000, 2000, & 5000 ppmv
Carbon Dioxide (CO <sub>2</sub> )	Non dispersive Infrared Absorption (NDIR)	0-5, 10, & 20 vol%
Sulfur Dioxide (SO <sub>2</sub> )	Non dispersive Infrared Absorption (NDIR). Cross flow modulation	0-200, 500, 1000, & 3000 ppmv
Oxygen	Zirconium oxide sensor	0-5, 10, & 25 vol%

For quality control, UCR carries out analyzer checks with calibration gases both before and after each test to check for drift. Because the instrument measures the concentration of five gases, the calibration gases are a blend of several gases (super-blend) made to within 1% specifications. Experience has shown that the drift is within manufacturer specifications of ±1% full scale per day shown in Table A-3. The PG-250 meets the analyzer specifications in ISO 8178-1 Section 7.4 for repeatability, accuracy, noise, span drift, zero drift and gas drying.

**Table A-3 Quality Specifications for the Horiba PG-250**

<b>Repeatability</b>	±0.5% F.S. (NO <sub>x</sub> : ≤ 100ppm range CO: ≤ 1,000ppm range) ±1.0% F. S.
<b>Linearity</b>	±2.0% F.S.
<b>Drift</b>	±1.0% F. S./day (SO <sub>2</sub> : ±2.0% F.S./day)

### ■ Replacement parts

Replacement part intervals assume 8 hours of operation per day.  
Replacement interval may be more frequent depending on measurement gas conditions and use conditions.

[Consumable Items]

Name	Replace Every (general guideline)	Notes
Mist catcher	3 months	MC-025
Scrubber	3 months	For reference line
Air filter element	2 weeks	For reference line

[Replacement Parts]

Name	Replace Every (general guideline)	Notes
Pump	1 year	Replace when broken
NO <sub>x</sub> converter catalyst	1 year	For NO <sub>x</sub> analyzer*
Zero gas purifier unit catalyst	1 year	*
Ozone generator	1 year	For NO <sub>x</sub> analyzer*
Deozoneizer	1 year	For NO <sub>x</sub> analyzer*
CR2032 battery	5 years	For clock backup
Galvanic O <sub>2</sub> cell	1 year	Replace when broken*

\* Differs depending on model

**Figure A-4b Gas analyzer replacement parts and maintenance**

## Measuring the Particulate Matter (PM) Emissions

ISO 8178-1 defines particulates as any material collected on a specified filter medium after diluting exhaust gases with clean, filtered air at a temperature of  $\leq 52^{\circ}\text{C}$  (40 CFR Part 1065 is  $47\pm 5^{\circ}\text{C}$ ), as measured at a point immediately upstream of the PM filter. The particulate consists of primarily carbon, condensed hydrocarbons, sulfates, associated water, and ash. Measuring particulates requires a dilution system and UCR selected a partial flow dilution system. The dilution system design completely eliminates water condensation in the dilution/sampling systems and maintains the temperature of the diluted exhaust gas at  $< 52^{\circ}\text{C}$  immediately upstream of the filter holders (and is typically below  $47^{\circ}\text{C}$  also). IMO does not offer a protocol for measuring PM and thus a combination of ISO and CFR practices are adopted. A comparison of the ISO and UCR practices for sampling PM is shown in Table A-4.

**Table A-4 Measuring Particulate by ISO and UCR Methods**

	ISO	UCR
Dilution tunnel	Either full or partial flow	Partial flow
Tunnel & sampling system	Electrically conductive	Same
Pretreatment	None	Cyclone, removes $>2.5\mu\text{m}$
Filter material	PTFE coated glass fiber	Teflon (TFE)
Filter size, mm	47 (37mm stain diameter)	Same
Number of filters in series	Two	One
Number of filters in parallel	Only single filter	Two; 1 TFE & 1 Quartz
Number of filters per mode	Single or multiple	Single is typical unless looking at artifacts
Filter face temp. $^{\circ}\text{C}$	$\leq 52$	Same
Filter face velocity, cm/sec	35 to 80.	$\sim 33$
Pressure drop, kPa	For test $< 25$	Same
Filter loading, $\mu\text{g}$	$> 500$	500-1,000 + water w/sulfate, post PM control $\sim 100$
Weighing chamber	$22\pm 3^{\circ}\text{C}$ & RH= $45\%\pm 8$	$22\pm 1^{\circ}\text{C}$ & dewpoint of $9.5^{\circ}\text{C}\pm 1^{\circ}\text{C}$ (typically $< \pm 0.6^{\circ}\text{C}$ )
Analytical balance, LDL $\mu\text{g}$	10	LDL = 3 and resolution 0.1
Flow measurement	Traceable method	Same
Flow calibration, months	$< 3$ months	Every campaign

**Sulfur content.** According to ISO, particulates measured using ISO 8178 are “conclusively proven” to be effective for fuel sulfur levels up to 0.8%. UCR is often faced with measuring PM for fuels with sulfur content exceeding 0.8% and has adopted the 40 CFR Part 1065 sampling methodologies as no other method is prescribed for fuels with a higher sulfur content.

## Calculating Exhaust Flow Rates

The calculated emission factor requires the measurement of the engine’s exhaust flow rate. The exhaust gas flow can be determined by the following methods:

1. Direct Measurement Method
2. Carbon Balance Method
3. Air and Fuel Measurement Method
4. Air Pump method

*Method 1: Direct Measurement of exhaust*

Actual exhaust mass flow rate can be determined from the exhaust velocity, cross sectional area of the stack, and moisture and pressure measurements. The direct measurement method is a difficult technique, and precautions must be taken to minimize measurement errors. Details of the direct measurement method are provided in ISO 5167-1.

*Method 2(a)-Carbon Balance*

Carbon Balance is used to calculate the exhaust mass flow based on the measurement of fuel consumption and the exhaust gas concentrations with regard to the fuel characteristics. The method given is only valid for fuels without oxygen and nitrogen content, based on procedures used for EPA and ECE calculations. Detailed calculation steps of the Carbon Balance method are provided in annex A of ISO 8178-1. Basically: In...lbs fuel/time \* wt% carbon \* 44/12 → input of grams CO<sub>2</sub> per time Out... vol % CO<sub>2</sub> \* (grams exhaust/time \* 1/density exhaust) → exhaust CO<sub>2</sub> per time

Note that the density = (mole wt\*P)/(R\* Temp) where P, T are at the analyzer conditions. For highly diluted exhaust, M ~ of the atmosphere.

*Method 2(b)-Universal Carbon/Oxygen balance*

The Universal Carbon/Oxygen Balance is used for the calculation of the exhaust mass flow. This method can be used when the fuel consumption is measurable and the fuel composition and the concentration of the exhaust components are known. It is applicable for fuels containing H, C, S, O, N in known proportions. Detailed calculation steps of Carbon/Oxygen Balance method is provided in annex A of ISO 8178-1.

*Method 3-Air and Fuel Measurement Method*

This involves measurement of the air flow and the fuel flow. The calculation of the exhaust gas flow is provided in Section 7.2 of ISO 8178-1.

*Method 4-Air Pump Method*

Exhaust flow rate is calculated by assuming the engine is an air pump, meaning that the exhaust flow is equal to the intake air flow. The flow rate is determined from the overall engine displacement, and rpm; corrected for temperature and pressure of the inlet air and pumping efficiency. In the case of turbocharged engines, this is the boost pressure and intake manifold temperature. This method should not be used for diesel engines equipped with additional air input for cylinder exhaust discharge, called purge or scavenger air, unless the additional flow rate is known or can be determined.

**Added Comments about UCR's Measurement of PM**

In the field UCR uses a raw particulate sampling probe fitted close to and upstream of the raw gaseous sample probe and directs the PM sample to the dilution tunnel. There are two gas streams leaving the dilution tunnel; the major flow vented outside the tunnel and the minor flow directed

to a cyclone separator, sized to remove particles  $>2.5\mu\text{m}$ . The line leaving the cyclone separator is split into two lines; each line has a 47 mm Gelman filter holder. One holder collects PM on a Teflon filter and the other collects PM on a quartz filter. UCR simultaneously collects PM on Teflon and quartz filters at each operating mode and analyzes the quartz filters utilizing the NIOSH or IMPROVE methods. UCR recommends the IMPROVE method over the NIOSH.

Briefly, total PM is collected on Pall Gelman (Ann Arbor, MI) 47 mm Teflon filters and weighed using a Mettler Toledo UMX2 microbalance with a 0.1  $\mu\text{g}$  resolution. Before and after collection, the filters are conditioned for 24 hours in an environmentally controlled room ( $22\pm 1\text{ }^\circ\text{C}$  and dewpoint of  $9.5\text{ }^\circ\text{C}$ ) and weighed daily until two consecutive weight measurements are within 3  $\mu\text{g}$  or 2%. It is important to note that the simultaneous collection of PM on quartz and Teflon<sup>TM</sup> filters provides a comparative check of PM mass measured by two independent methods for measuring PM mass.

Sulfur in the fuel produces  $\text{SO}_2$  in the combustion process and some of the  $\text{SO}_2$  becomes  $\text{SO}_3$  in the exhaust and subsequently produces  $\text{H}_2\text{SO}_4\bullet 6\text{H}_2\text{O}$  which is collected on the Teflon filter paper. After the final weights for the particulate laden Teflon filters have been determined a portion of the filter is punched out, extracted with High Performance Liquid Chromatography grade water and isopropyl alcohol and analyzed for sulfate ions by ion chromatography.

### Measuring Real-Time Particulate Matter (PM) Emissions-DustTrak 8520

In addition to the filter-based PM mass measurements, UCR uses a Nephelometer (TSI DustTrak 8520) for continuous measurements of steady-state and transient data. The DustTrak is a portable, battery-operated laser photometer that gives real-time digital readout and has a built-in data logger. It measures light scattered (90 degree light scattering at 780nm near-infrared) by aerosol introduced into a sample chamber and displays the measured mass density in units of  $\text{mg}/\text{m}^3$ . As scattering per unit mass is a strong function of particle size and refractive index of the particle size distributions and as refractive indices in diesel exhaust strongly depend on the particular engine and operating condition, some question the accuracy of PM mass measurements. However, UCR always references the DustTrak results to filter based measurements and this approach has shown that mass scattering efficiencies for both on-road diesel exhaust and ambient fine particles have values around  $3\text{m}^2/\text{g}$ .

Figure A-5 Picture of TSI DustTrak

### Measuring Non-Regulated Gaseous Emissions

Neither ISO nor IMO provide a protocol for sampling and analyzing non-regulated emissions. UCR uses peer reviewed methods adapted to their PM dilution tunnel. The methods rely on added media to selectively collect hydrocarbons and PM fractions during the sampling process for

subsequent off-line analysis. A secondary dilution is constructed to capture real time PM this same tunnel was used for DNPH and Canister samples. In addition, UCR collected raw grab samples of the

## Appendix B – Quality Control

### Pre-test calibrations

Prior to departing from UCR all systems will be verified and cleaned for the testing campaign. This included all instruments used during this testing project. Sample filters are checked and replaced if necessary.

### On-site calibrations

Pre- and post-test calibrations were performed on the gaseous analyzer using NIST traceable calibration bottles. Dilution ratio was monitored and verified at least twice each test day. Leak checks were performed for the total PM<sub>2.5</sub> system prior testing for each setup.

### Post-test and data validation

Post-test evaluation includes verifying consistent dilution ratios between points and data is compared to other test conditions that are similar.

The figure below (Figure B-1) is an example of a chain of custody form. This is the form used to track filter weights from the test to the laboratory. One form for the filter weights, BTEX, and EC/OC. This is just an example of media tracking that is used.

Figure B-2 is an example of UCR certified calibration bottles used for testing. Prior to using a new bottle the old one is verified with the new one as bottles can incorrect in their stated value. It is rare, but can happen.

## Appendix C –Test Assumptions

**Figure C-1: Real Time Response for selected emissions species with test notes**

Initial sample times were chosen based on previous projects and soot levels. Initial sampling was started as soon as possible with a total sample time of 75 minutes. During the second test, a power failure on the ship cut testing short for a total sample time of 27 minutes. The final test sample was started as soon as power was restored and lasted as long as possible for a total testing time of 43 minutes. The real time data shows that all sample times experienced unstable data trends. The first test experienced unstable CO<sub>2</sub>, NO<sub>x</sub>, and Soot data at the beginning of the test most likely due to the boiler not being fully warmed up. The second test experienced soot, NO<sub>x</sub>, and CO<sub>2</sub> spikes toward the end of the test. The third test showed elevated levels of CO<sub>2</sub> and NO<sub>x</sub> for unknown reasons.

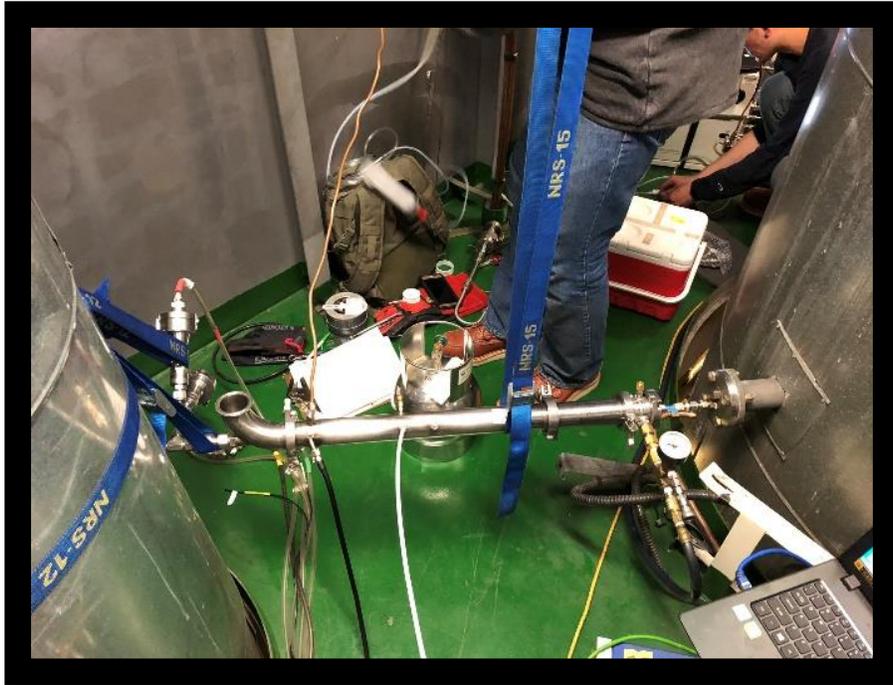

Figure C-2 Installation showing removal of cyclone.

Due to the unstable nature of all 3 test points, modified sampling times were used to capture stable data during the course of testing. PM results were averaged with the soot data from the original tests, and a weighting factor was used to calculate PM mass of the modified sample times.

## Atmospheric Analysis & Consulting, Inc.

CLIENT : UC Riverside  
 PROJECT NAME : UCR  
 AAC PROJECT NO. : 191896  
 REPORT DATE : 11/12/2019

On November 4, 2019, Atmospheric Analysis & Consulting, Inc. received four (4) Six-Liter Summa Canisters for Fixed Gases analysis by EPA 3C. Upon receipt, the samples were assigned unique Laboratory ID numbers as follows:

Client ID	Lab No.	Return Pressure (mmHg)
10:1 Dilute w/ CFO	191896-3083	723.0
10:1 Dilute Grab Sample	191896-3084	622.0
Raw Grab Sample 1252	191896-3085	519.4
Raw Grab Sample 1257	191896-3086	565.6

This analysis is performed in accordance with AAC's Quality Manual. For detailed information pertaining to specific EPA, NCASI, ASTM and SCAQMD accreditations (Methods & Analytes), please visit our website at [www.aaclab.com](http://www.aaclab.com).

I certify that this data is technically accurate, complete, and in compliance with the terms and conditions of the contract. No problems were encountered during receiving, preparation, and/or analysis of these samples.

The Technical Director or his/her designee, as verified by the following signature, has authorized release of the data contained in this hardcopy report.

If you have any questions or require further explanation of data results, please contact the undersigned.

  
 Sucha Parmar, Ph.D.  
 Technical Director

### Laboratory Analysis Report

CLIENT : University of California, Riverside  
 PROJECT NO : 191896  
 UNITS : ppbC

DATE RECEIVED : 11/04/2019  
 DATE REPORTED : 11/08/2019

## Appendix E –Exhaust Flow

The calculation follows EPA Method 2 which utilizes a type S Pitot tube is used to measure the differential pressure between the counter-flow (static pressure) and parallel-flow (dynamic pressure) directions. Velocity is calculated using Bernoulli’s principle, which states that the pressure in a stream of fluid is reduced as the speed of the flow is increased. The velocity calculation is based off of the temperature, molecular weight of the exhaust gas, static pressure, dynamic pressure, and relative humidity. Measurement of the differential pressure and temperature were repeated at the sampling site several times at different depths inside the duct, including the near side of the duct, in the middle of the duct, and the far side of the duct. The equation below is from the EPA Method 2 documents Equation 2-7 and 2-8.

$$V_s = K_p C_p \left[ \frac{\sum_{i=1}^n \sqrt{\Delta P_i}}{n} \right] \sqrt{\frac{T_{s(abavg)}}{P_s M_s}} \quad .Q = 3600(1 - B_{ws}) v_s A \left[ \frac{T_{std} P_s}{T_{s(abavg)} P_{std}} \right]$$

Where:

- A = Cross-sectional area of stack, m<sup>2</sup> (ft<sup>2</sup>).
- B<sub>ws</sub> = Water vapor in the gas stream
- C<sub>p</sub> = Pitot tube coefficient, dimensionless.
- K = 0.127 mm H<sub>2</sub>O (metric units). 0.005 in. H<sub>2</sub>O (English units).
- K<sub>p</sub> = Velocity equation constant.
- M<sub>s</sub> = Molecular weight of stack gas, wet basis, g/g-mole (lb/lb-mole).
- n = Total number of traverse points.
- P<sub>g</sub> = Stack static pressure, mm Hg (in. Hg).
- P<sub>s</sub> = Absolute stack pressure (P<sub>bar</sub> + P<sub>g</sub>), mm Hg (in. Hg),
- P<sub>std</sub> = Standard absolute pressure, 760 mm Hg (29.92 in. Hg).
- Q<sub>sd</sub> = Dry volumetric stack gas flow rate corrected to standard conditions, dscm/hr (dscf/hr).
- T<sub>s(abavg)</sub> = Average absolute stack temperature, °K (°R).
- T<sub>s</sub> = Stack temperature, °C (( °deg:F).
- T<sub>std</sub> = Standard absolute temperature, 293 °K (528 °R).
- V<sub>s</sub> = Average stack gas velocity, m/sec (ft/sec).
- Δp = Velocity head of stack gas, mm H<sub>2</sub>O (in. H<sub>2</sub>O).
- Δp<sub>i</sub> = Individual velocity head reading at traverse point “i”, mm (in.) H<sub>2</sub>O.
- Δp<sub>std</sub> = Velocity head measured by the standard pitot tube, cm (in.) H<sub>2</sub>O.
- Δp<sub>s</sub> = Velocity head measured by the Type S pitot tube, cm (in.) H<sub>2</sub>O.

Table E-1 Summary of direct measurements from the pitot tube sampling

Stack Diam mm	Traverse Side B	Time Start (HH:MM)	Load	Average Pitot DelP			Average Pitot Static P			Temp (C)
				(inH2O)	(mmH2O)	(mmH2O) ^0.5	(inH2O)	(mmH2O)	(mmH2O) ^0.5

## Appendix F –Raw Data and Analysis

The summary results in this Appendix include raw data used to generate the values in the report including outside laboratory results. The tables of data show the results for boiler for gaseous and PM emissions. The boiler toxic emissions are also listed below. The EC/OC results were sent to an outside laboratory and were analyzed using the NIOSH thermal optical method.

There were only three test points sampled during this testing. As discussed in Section 2.5, the data needed correction due to good engineering judgement that the full sample was not stable. The gray data represents the corrected data (“adjusted”) and the non-gray data in Tables F-1 through F-3 are the original data samples so one can see the impact.

**Table F-1 emissions data per test point for the original data and the “adjusted” data (gray).**

**Re: PROPOSED CONTROL MEASURE FOR OCEAN-GOING VESSELS AT BERTH**

The Coalition for Clean air submits these comments in support of the California Air Resources Board's proposed Control Measure for Ocean-Going Vessels ("OGVs") At Berth ("At Berth Regulation"). OGVs cause immense amounts of air pollution globally and particularly when in port when they are closest to people who live near, and work at, California's ports. OGVs are sources of both nitrogen oxide ("NOx") and particulate matter ("PM") emissions, both of which cause grave health impacts. Further, California is in non-attainment of NOx reduction goals under the federal Clean Air Act. Air Districts across the state are working to reduce NOx and other criteria pollutants from stationary sources. Moving OGVs from using diesel auxiliary engines, sources of both NOx and PM, in port to alternatives such as plugging into electrical power or using capture-and-control technology will reduce air pollution and improve public health. As a result, we urge the California Air Resources Board ("ARB") to adopt this regulation at its August meeting and move forward with its implementation as soon as possible.

**I. Public Health Benefits of At Berth Regulation Are Obvious and Relevant**

Our primary reason for supporting the At Berth regulation is to protect public health. As stated in the ARB Staff Report: Initial Statement of Reasons ("SOR," released October 15, 2019), OGV emissions include criteria pollutants, air toxic contaminants, and greenhouse gases. (SOR, ES-2; see also SOR p. I-10.) As stated above, one of the main pollutants from an OGV is NOx. Exposure to NOx can cause respiratory irritation, aggravation of respiratory diseases, especially asthma, causing coughing, wheezing and difficulty breathing, all of which can lead to emergency room visits and hospital admissions for those people affected. (Id.) Negative public health impacts from NOx emissions are a main reason we strongly support adoption of this regulation. "California's combination of unique geography and robust freight contributes to our state experiencing some of the worst air quality in the nation." (SOR, ES-4.)

Another harmful emission from OGV operations is particulate matter ("PM") that can be inhaled into upper airways and lungs, creating respiratory ailments leading to still more public health concerns. The current COVID-19 pandemic provides a sobering demonstration of the need to protect respiratory health: experts have found that exposure to particulate matter increases COVID-19 mortality. ("Exposure to air pollution and COVID-19 mortality in the United States," Xiao Wu MS, Rachel C. Nethery PhD, M. Benjamin Sabath MA, Danielle Braun PhD, Francesca Dominici PhD, Harvard T.H. Chan School of Public Health, Updated April 5, 2020.)

Exposure to PM 2.5 can increase premature mortality, hospital admissions for cardiopulmonary causes, acute and chronic bronchitis, asthma attacks, and respiratory symptoms. The health effects are of particular concern for sensitive groups such as infants, children, the elderly, and those with preexisting heart or lung disease. (SOR, ES-3; see also SOR p. V-15-19, and ARB, “Inhalable Particulate Matter and Health [PM2.5 and PM10]”, August 10, 2017, <https://ww3.arb.ca.gov/research/aags/common-pollutants/pm/pm.htm>.)

Researchers at McGill University followed over a million adults in Toronto and Montreal and their medical records from 1991 to 2016. The studies found:

“New research has linked air pollution nanoparticles to brain cancer for the first time. The ultra-fine particles (UFPs) are produced by fuel burning, particularly in diesel vehicles, and higher exposures significantly increase people’s chances of getting the deadly cancer. Previous work has shown that nanoparticles can get into the brain and that they can carry carcinogenic chemicals.” (The Guardian, Air Pollution Nanoparticles Linked to Brain Cancer for First Time, November 13, 2019 <https://www.theguardian.com/environment/2019/nov/13/air-pollution-particles-linked-to-brain-cancer-in-new-research>.) The article further documented:

“The discovery of abundant toxic nanoparticles from air pollution in human brains was made in 2016. A comprehensive global review earlier in 2019 concluded that air pollution may be damaging every organ and virtually every cell in the human body. Toxic air has been linked to other effects on the brain, including huge reductions in intelligence, dementia and mental health problems in both adults and children. The World Health Organization says air pollution is a “silent public health emergency”.” (Id.)

It is critical that we protect public health in areas near ports; most of which are “disadvantaged communities” and have suffered environmental injustices for years or even decades. These areas tend to be comprised of the working poor and people of color who contend daily with the various and cumulative pollution burdens of goods movement, such as proximity to heavy duty trucks, locomotives, cargo handling equipment and OGVs. (SOR p. II-1,2, p. V-9 and V-15; see also Office of Environmental Health Hazard Assessment, CalEnviroScreen 3.0, June 25, 2018, <https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-30>.)

The Proposed At Berth Regulation would improve on the existing At Berth Regulation by covering more OGVs and by lowering the visit threshold for determining which ports or terminals are encompassed by the rule. We are supportive of these changes, as they ensure that public health benefits accrue from all ships that visit a California port or independent marine terminal that exceeds 20 OGV visits annually. To continue to apply a regulation to fewer ships and ports would also continue to allow poor air quality to result from those ship visits. As a result, we support the new Regulation whole-heartedly and urge the ARB to implement the regulation beginning on January 1, 2021.

**II. Proposed At Berth Regulation Is a Cost Effective Way to Reduce Emissions and Protect Health**

Although the total price tag of the At Berth Regulation appears high, when measured against the direct health benefits and the actual cost to the average consumer, it is clearly a worthy investment in a cleaner goods movement system and a healthier California populace.

The Proposed At Berth regulation will improve health benefits for all Californians and particularly communities directly impacted by port operations. Specifically, by 2032, the health benefits would total \$2.32 billion from 237 fewer premature deaths, 75 fewer hospital admissions, and 122 fewer emergency room visits statewide, while total costs for all 4 entities to implement would total about \$2.23 billion, while. In addition, potential cancer risks will be reduced by approximately 60%. (SOR VI-1,2.) From the Ports of Long Beach and Los Angeles alone—which are just two of the several ports and independent marine terminals expected to be affected by this rulemaking in California—about 2.4 million residents would have a reduced potential cancer risk from implementing the updated At Berth Regulation. (Id., see also p. V-15, p. III-7.)

The annual cost to the average individual consumer for these substantial health benefits is negligible.

### III. The Proposed 15-Day Changes

A. Delayed Implementation Schedule for Ro-ros Is Unjustified. We oppose moving back the emissions control requirements for these vessels because it will result in greater emissions in 2024. At the June Board meeting, no convincing evidence was introduced to support the rollback; in fact, a persuasive case was made that the delay will prolong the suffering of communities in the San Diego area who are exposed to diesel fumes from ro-ros.

19-1

B. The Innovative Concept Provision Must Retain Safeguards, And Community Steering Committees Must Be Consulted. The innovative concept provision responds to the requests of the Western States Petroleum Association, Pacific Merchant Shipping Association and some ports. We welcome cost-effective alternative projects that achieve equivalent or greater emission reductions in the impacted communities at a lesser cost, but the provision must not become a loophole. Therefore, it is important that the alternatives reduce criteria pollutants at least as much as the controls would in the time frame needed to be in compliance, do not increase greenhouse gas emissions or increase emissions at other ports or terminals, provide additional reductions that would not have otherwise occurred, and do not use public funds. Furthermore, we agree that consideration of any innovative concepts should involve consulting with Community Steering Committees for AB 617 communities affected by at-berth emissions.

Respectfully submitted,

Bill Magavern

Policy Director

Coalition for Clean Air

**Re: Control Measure for Ocean-Going Vessels At Berth ("At-Berth Rule")  
Draft Environmental Analysis CEQA Violations**

California Air Resources Board:

Crowley Maritime Corporation ("Crowley") submits this additional comment, in advance of the Public Hearing on August 27, 2020, addressed to the CEQA<sup>1</sup> violations of the Draft Environmental Analysis, Appendix D to the Staff Report: Initial Statement of Reasons released on October 15, 2019. We ask that it be taken into proper consideration.

**I. Introduction**

While CARB's certified regulatory programs are exempt from certain procedural aspects of CEQA, CARB's actions remain subject to all other CEQA provisions. Moreover, it is the express policy of CARB to prepare staff reports in a manner consistent with the environmental protection purposes of the Board's regulatory program and with the goals and policies of CEQA<sup>2</sup>.

CEQA generally requires state and local government agencies to inform decision makers and the public about the potential environmental impacts of proposed projects, and to reduce those environmental impacts to the extent feasible. CEQA thus requires that the Environmental Analysis that provides the basis for the Board's decision provide full disclosure, a comprehensive analysis of significant environmental impacts, and an assessment of feasible mitigation measures. As explained in the CEQA Guidelines, "public agencies shall not undertake actions concerning the proposed public project that would have a significant adverse effect or limit the choice of alternatives or mitigation measures, before completion of CEQA compliance." 14 Cal. Code Regs., § 15004(b)(2).

---

<sup>1</sup> Public Resources Code §21000, *et seq.*

<sup>2</sup> 17 Cal. Code Regs., § 60005(b).

## II. Summary

The Draft Environmental Analysis commits a number of *per se* CEQA violations in connection with its omission to address the environmental impact of the exclusion of articulated tug barges (ATBs) from the At-Berth Rule. As an environmental document, the Draft Environmental Analysis violates CEQA by failing to accurately and comprehensively describe the “project”, failing to analyze the environmental impact of the regulatory policy of excluding ATBs from the At-Berth Rule, and failing to assess the feasibility of mitigation measures. The CEQA violations of the Draft Environmental Analysis are highly significant. Final agency approval of the proposed regulation must be postponed pending lawful completion of the required CEQA procedures.

## III. Comment

Underlying the ATB exclusion is an evident policy to retain the regulation of ATBs under the Commercial Harbor Craft (CHC) regulation, despite the opportunity that the At-Berth Rule now affords for ATBs to be properly regulated alongside, and as, ocean-going tank vessels. This policy is misinformed.

During the past 18 months of this rulemaking process, Crowley, the largest U.S. operator of ATBs in California, has repeatedly, consistently and specifically explained the compelling need for ATBs to be regulated, like other ocean-going tank vessels, under the At-Berth Rule. Crowley takes this position, in part, because it makes no sense to exclude ATBs from the proposed regulation, and, in part, because there is no feasible alternative.

As discussed below, Crowley’s fleet of ATBs cannot operate economically if they are required to be retrofitted as required by the proposed revised CHC. So, if ATBs are not regulated under the At-Berth Rule, Crowley’s ATB fleet will inevitably be withdrawn from California, and the clean petroleum products (CPP) currently transported by ATBs would be carried by increased numbers of Medium Range (MR) tankers.

1-1

Under the circumstances, it makes no sense for CARB to hold onto this policy of excluding ATBs from the At-Berth Rule, which, as addressed below, is wrong-headed and unsupportable. Crowley continues to urge CARB to delete the ATB exclusion. This simple amendment would improve air quality and benefit the communities living in the vicinity of California’s marine terminals.

If the Board is asked to approve the proposed At-Berth rule without removing the ATB exclusion, it cannot do so unless and until the Draft Environmental Analysis complies with CEQA procedures.

#### IV. CEQA Violations

If the proposed regulation is to continue to include the ATB exclusion, the proposed At Berth Rule cannot be approved by the Board based on the Draft Environmental Analysis, because it fails to follow CEQA's procedures.

##### A. Failure to Analyze the Impact of the Regulatory Policy to Exclude ATBs

1-2

##### (i) Failure to Follow CEQA Procedures for Describing the "Project"

The Draft Environmental Analysis fails to analyze the environmental impact and feasibility of mitigation measures arising from the express policy of the proposed regulation to exclude ATBs. This glaring omission stems from the failure of the Draft Environmental Analysis to describe and analyze the proposed regulation adequately. Whether this is a deliberate refusal to draw attention to this policy aspect of the proposed regulation or merely an inadvertent oversight, it is clearly a *per se* CEQA violation.

Under CEQA, the Environmental Analysis must contain a precise description of the project, including "a general description of the project's technical, economic and environmental characteristics."<sup>3</sup> The proper and accurate description of the project is the *sine qua non* of an informative and legally-sufficient environmental document.

The Draft Environmental Analysis does not comply with this CEQA requirement. It begins<sup>4</sup> with CARB's determination that the proposed regulation is a "project" as defined by CEQA, and recites the definition of project set forth in the CEQA Guidelines<sup>5</sup>.

But then the Draft Environmental Analysis continues by never properly describing the regulation. In particular, the Draft Environmental Analysis fails to appreciate that the express exclusion of the ATBs from the At Berth Rule is itself a policy of the proposed regulation, as to which the environmental impact needs to be analyzed and, if possible, minimized or mitigated.

---

<sup>3</sup> 14 Cal. Code of Regs., §15124(c).

<sup>4</sup> Draft Environmental Analysis, p.3.

<sup>5</sup> "[T]he whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment, and that is an activity directly undertaken by any public agency. 14 Cal. Code Regs. §15378(a).

Ignoring the ATB exclusion policy leads the Draft Environmental Analysis to the following incorrect conclusion: “the policy aspects of the Proposed Regulation do not directly change the physical environment”.<sup>6</sup> Based on this misconception, the Draft Environmental Analysis proceeds to confine its analysis to “indirect physical changes to the environment [that] could result from reasonably foreseeable compliance responses taken in response to implementation actions identified in the Proposed Regulation.”

The failure of the Draft Environmental Analysis to follow CEQA’s mandate to describe the regulation accurately is a *per se* CEQA violation. That failure is significant, because, by overlooking what the proposed regulation is intended to achieve, the Draft Environmental Analysis is led to omit entirely any analysis of the environmental impact of the ATB exclusion or whether that impact can be feasibly mitigated. ATBs are not even mentioned in the Draft Environmental Analysis.

(ii) The ATB Exclusion is Manifestly a Policy of the Regulation

The policy of the proposed regulation to exclude ATBs is expressed through specifically inserting an exception into the definition of ocean-going vessels.<sup>7</sup> This policy has no operational basis or rationale.

In the Initial Statement of Reasons, CARB staff state, as the sole reason offered for excluding ATBs from the At-Berth Rule, the following:

“When an articulated tug barge is fully connected, it may meet the definition of an ocean-going vessel, as defined in this chapter (Section 93130.2(b)). However, despite being defined as a subcategory of tankers, articulated tug barges are considered a barge and a tug separately.” [p. IV-6.]

This statement makes no sense whatsoever and is incorrect<sup>8</sup>.

---

<sup>6</sup> Draft Environmental Analysis, p.3.

<sup>7</sup> The exclusion is contained in two subsections of the definition section of the proposed regulation, section 93130(b)(7) and (b)(50).

<sup>8</sup> Crowley’s 120,000 bbls. ATBs are modern tank vessel which carry cargo in a double-hulled tank barge equipped with sumped cargo tanks, remote gauging, an inert gas system, and other systems, and is propelled and maneuvered by a high-horsepower tug that is physically a part of the whole vessel, positioned in a notch in the stern of the barge, and attached by rigid, articulating pins, and is itself considered an “ocean going vessel”, under applicable federal law. For the purpose of improved safety and environmental protection, ATBs function as a single unit in a system that allows for better maneuverability and sea-

Under the circumstances, the stated basis for the ATB exclusion is arbitrary and capricious.

The proposed regulation incorporates a definition of tanker vessels<sup>9</sup> and provides<sup>10</sup> a description of an “ocean-going vessel”<sup>11</sup> that exactly describe Crowley’s 550 and 650 Class ATBs. ATBs are unquestionably ocean-going vessels. ATBs operate as a single vessel. As Crowley, the largest operator of tankers and ATBs in the United States, has explained to CARB and its staff during this rulemaking process, ATBs of more than 120,000 bbl. capacity (or at least 20,000 DWT) are the functional equivalent of ocean-going tankers that are the subject of the At-Berth Rule.

Under the circumstances, the exclusion of ATBs from the At-Berth Rule must be recognized for what it is: a deliberate policy determination regarding how ATBs should be regulated. CARB staff have determined, despite consistent and clear information to the contrary from Crowley, that ATBs should not be regulated like other ocean-going tankers, but rather as if they were operating in the same manner as California-based harbor tugs<sup>12</sup>.

The exclusion of ATBs from the proposed At-Berth Rule can only be characterized as an affirmative regulatory policy of CARB’s that ATBs should not be regulated like other ocean-going tank vessels. Under CEQA, the Draft Environmental Analysis is required to

---

keeping over separate, conventional tug and wire towed tank barges. By definition, an articulated tug barge is an ocean-going vessel that functions “as one vessel.”

<sup>9</sup> The Initial Statement of Reasons defines tanker vessels as those vessels “designed to carry liquid or gaseous products, including crude oil or other hydrocarbon products, such as Liquid Liquefied Petroleum Gas (LPG), Liquid Natural Gas (LNG); chemicals, such as ammonia, chlorine, and styrene monomer, asphalt, and even fresh water. [ES-2]

<sup>10</sup> See 17 Cal. Code Regs. §93130.2(b).

<sup>11</sup> A vessel “generally greater than 400 feet, weigh more than 10,000 gross tons, and have per-cylinder engine displacement of greater than 30 liter/cylinder”.

<sup>12</sup> There is no rational basis for regulating ATBs as commercial harbor craft. The only initial reason for including ATBs in the CHC regulation was that, before the proposed extension of the At-Berth Rule to cover ocean-going vessels, there was no alternative. But there was never any other operational rationale for regulating ATBs as if they were harbor tugs. Unlike the commercial harbor craft regulated by the CHC regulation, Crowley’s ATB Fleet is not based in California and does not operate predominately in California ports performing operations of harbor tugs. Like other ocean-going tank vessels, Crowley’s ATBs transport cargo, including to and from California marine terminals, and their operations in California waters consist of transit to and from sea and in interstate commerce, maneuvering and conducting cargo operations at berth. They are not harbor tugs.

analyze whether that policy has a significant environmental impact. The Draft Environmental Analysis fails to do so. 1-2 cont.

(iii) The Draft Environmental Analysis Fails to Identify and Analyze the Environmental Impact of the ATB Exclusion Policy 1-3

The environmental impact of the policy of excluding ATBs is the emissions reductions achieved by the proposed At-Berth Rule do not take into account the ATB emissions. The impact of the policy is to deliberately lessen the emissions reductions resulting from the At-Berth rule. The Draft Environmental Analysis ignores this environmental impact and fails to analyze it.

Crowley, however, has done its own analysis, which we offer here by way of an example of the environmental impact assessment that the Draft Environmental Analysis fails to include. Crowley analyzed the emissions profile of one of its 650 Class ATBs, the *Vision/650-10*<sup>13</sup>, based on actual operational conditions<sup>14</sup>:

(a) from or to 3 nm from the harbor entrance before or after maneuvering (Port Zone or “PZ”);

(b) during maneuvering near berth during arrival or departure; and

(c) at berth.

Crowley’s analysis showed the following baseline<sup>15</sup> for ATB emissions for one of its 650 Class ATBs, *Vision/650-10*, assuming compliance with current commercial harbor craft regulations:

---

<sup>13</sup> The actual engine specifications of the *Vision/650-10* were used.

<sup>14</sup> For the tug (*Vision*) engines, the assumptions were 50% main engine load in PZ Zone, 20% main engine load in maneuvering zone, and 50% auxiliary engines for all zones. For the barge (650-10) engines, the assumptions were 60% load at berth, using one large (800 BHP) and one small (1202 BHP) engines. All engines use ultra-low sulfur fuel.

<sup>15</sup> The baseline emissions of *Vision/650-10* were calculated using Tier 2 emission factors consistent with California Air Resources Board and the Port of Los Angeles and the Port of Long Beach latest emissions inventories.

	Mode	PM tons per trip	PM2.5 tons per trip	DPM tons per trip	NOx tons per trip	SOx tons per trip	CO2 e MT per trip
Vision	PZ	0.003	0.003	0.003	0.08	0.0001	6.0
650-10	PZ	0.000	0.000	0.000	0.00	0.0000	0.0
Vision	Maneuvering	0.001	0.001	0.001	0.04	0.0000	2.9
650-10	Maneuvering	0.000	0.000	0.000	0.00	0.0000	0.0
Vision	Berth	0.003	0.003	0.003	0.07	0.0001	5.3
650-10	Berth	0.013	0.012	0.013	0.34	0.0003	26.2
Power Plant							0.0
Total		0.020	0.019	0.020	0.53	0.0005	40.4

Crowley further analyzed the emissions that would result if the ATB were regulated under the At-Berth Rule and used the shore power option:

	Mode	PM tons per trip	PM2.5 tons per trip	DPM tons per trip	NOx tons per trip	SOx tons per trip	CO2 e MT per trip
Vision	PZ	0.003	0.003	0.003	0.08	0.0001	6.0
650-10	PZ	0.000	0.000	0.000	0.00	0.0000	0.0
Vision	Maneuvering	0.001	0.001	0.001	0.04	0.0000	2.9
650-10	Maneuvering	0.000	0.000	0.000	0.00	0.0000	0.0
Vision	Berth	0.000	0.000	0.000	0.01	0.0000	0.7
650-10	Berth	0.000	0.000	0.000	0.00	0.0000	0.0
Power Plant							11.3
Total		0.004	0.004	0.004	0.13	0.0001	20.9

Crowley also analyzed the emissions that would result if the ATB were regulated under the At-Berth Rule and employed the option of using Alternative Control Technology:

1-3  
cont.

	Mode	PM tons per trip	PM2.5 tons per trip	DPM tons per trip	NOx tons per trip	SOx tons per trip	CO2 e MT per trip
Vision	PZ	0.003	0.003	0.003	0.08	0.0001	6.0
650-10	PZ	0.000	0.000	0.000	0.00	0.0000	0.0
Vision	Maneuvering	0.001	0.001	0.001	0.04	0.0000	2.9
650-10	Maneuvering	0.000	0.000	0.000	0.00	0.0000	0.0
Vision	Berth	0.000	0.000	0.000	0.01	0.0000	0.7
650-10	Berth	0.003	0.002	0.003	0.07	0.0003	26.2
Power Plant							0.0
Total		0.007	0.006	0.007	0.20	0.0004	35.8

This analysis, which measures the emissions from only one ATB on one trip to a California port, should leave no doubt that CARB's policy decision to exclude ATBs from the At-Berth Rule has an environmental impact:

**Criteria pollutant emissions due to at-berth operations are clearly higher if the ATB exclusion policy is implemented than if CARB were to regulate ATB's, like other ocean-going tank vessels, under the At-Berth Rule.**

CEQA requires that the Draft Environmental Analysis perform an evaluation of the significance of this environmental impact. The Draft Environmental Analysis fails to follow this procedural step and is a *per se* violation of CEQA.

**B. Failure to Analyze Feasible Alternatives to Minimize Adverse Effects**

1-4

CEQA requires that written documentation prepared under a certified regulatory program, such as the Draft Environmental Analysis, must include a description of "mitigation measures to minimize any significant adverse effect on the environment of the activity." CEQA, § 21080.5(d)(3)(A). This obligation to describe mitigation measures

is one of the procedural requirements of CEQA “intended to assist public agencies in systematically identifying both the significant effects of proposed projects and the feasible alternatives or feasible mitigation measures which will avoid or substantially lessen such significant effects.” (§ 21002.)

1-4  
cont.

The Draft Environmental Analysis fails to proceed in the manner required by CEQA. Under CEQA, the Draft Environmental Analysis is required to analyze the feasibility of the alternative to the proposed regulation which will mitigate or minimize the environmental impact of excluding ATBs from the At-Berth Rule. It fails to do so. As has been stated, the Draft Environmental Analysis fails even to discuss ATBs.

1-5

This failure of the Draft Environmental Analysis to undertake the analysis of feasible alternatives is another *per se* violation of CEQA that undermines the entire environmental analysis of the regulation.

The implication is clear, as stated in the Initial Statement of Reasons, that CARB has made the determination that it would prefer to regulate ATBs, as if they were harbor craft, under the CHC regulation. Therefore, in this context, the mitigation analysis must necessarily involve an evaluation of the feasibility of the regulation of ATBs under the revised CHC rules.

CARB’s policy to regulate ATBs under the CHC regulations evidently assumes the adoption of the revised CHC regulations<sup>16</sup>, as to which a rulemaking process is underway. Under CEQA, before the Board approves those revisions to the CHC regulations, a proper, CEQA-compliant environmental review of those revisions must be conducted. That has not occurred. Therefore, CARB is not entitled to take a regulatory action in connection with the At Berth rule based on the assumption that the as-yet unadopted revised CHC regulation might provide an alternative. This is not merely CARB putting the cart before the horse, it is illegal under CEQA.

In this case, however, the impropriety of implementing a policy based on a regulation that has not undergone the proper rulemaking process, and the failure of the Draft Environmental Analysis to determine the feasibility of such a potential future regulation as an alternative, is overshadowed by one simple fact: for Crowley’s ATBs, the revised CHC regulations are not a feasible option. Compliance with the revised CHC regulations, as currently proposed, is commercially prohibitive.

To understand why, the Board needs to understand the commercial context, a matter of feasibility that the Draft Environmental Analysis ignores.

---

<sup>16</sup> See, Initial Statement of Reasons, page IV-6.

As U.S.-flagged Jones Act tank vessels, Crowley's large, militarily-useful, greater than 120,000 barrel ATBs are employed in California under charter to oil majors with rates that reflect the speed, efficiency and flexibility of ATBs and allow Crowley's ATBs to compete with MR tankers. Generally-speaking, it is reasonable to propose that Crowley's customers choose to transport clean petroleum products (CPP) in ATBs because Crowley's ATBs compete favorably with MR tankers on cost of transportation. In addition to safety and reliability, economically, refinery customers care mainly about "dollars per barrel delivered" by the vessel from the refinery tank terminal to the distribution tank terminal.

If Crowley ATBs were required to comply with the revised CHC regulation, even assuming the availability of the technology that those revisions contemplate, Crowley estimates that the potential compliance cost for its entire fleet would be prohibitive. As Crowley has commented, including in its letter to CARB of April 29, 2020, the potential cost of retrofitting Crowley's ATB fleet to meet the equipment standards of the CHC revisions would be almost \$126 million. From a commercial perspective, this cost cannot be absorbed by Crowley or through increases in charter rates.

If Crowley were to make such an expenditure to comply with the revised CHC regulations, while, at the same time, MR Tankers enjoy the competitive advantage of operating under the At Berth Rule, it can reasonably be expected that a point will be reached at which the cost of barrels delivered by Crowley's ATBs in California will be significantly more than the cost per barrel delivered by an MR tanker. When this point is reached, ATBs will no longer be employed in the California market. When ATBs are no longer available to the oil majors currently chartering ATBs, the cost of CPP transportation will be greater, and there may be an increase in the cost of CPP paid by California refineries, which will be passed to the California consumer.

Therefore, the impact of imposing the revised CHC upon ATBs, and excluding ATBs from the At-Berth Rule, is likely to be that Crowley's ATBs will no longer operate in California. Given that MR tankers would be regulated under the At-Berth Rule, there would be no way for Crowley's ATBs to compete with MR tankers. This would mean that California's CPP would be transported by MR tankers, and the commercial, safety and environmental benefits of using ATBs would no longer be available.

The proposed revised CHC regulations thus offer no feasible alternative to the At Berth rule, if the ATB exclusion is retained. For Crowley, excluding ATBs from the At Berth rule would have the practical effect of banning its ATBs from California operations.

The Draft Environmental Analysis fails to comply with CEQA procedures to analyze alternatives to minimize the adverse environmental effect of the ATB exclusion. Final agency approval of the proposed regulation must be postponed pending lawful completion of the required CEQA procedures.

**C. Failure to Disclose the Basis for Data**

1-6

CEQA requires full disclosure. The Draft Environmental Analysis is also deficient under CEQA in its failure to disclose whether the data used to calculate the baseline analysis and measure the effect of the At-Berth regulation includes or excludes ATBs. It thus fails to provide the public with any proper basis to determine the claimed impact of the proposed regulation.

This is crucially important. When drawing up the baseline analysis or analyzing the effect of the At-Berth regulation on air quality, failing to take into account ATBs, which account for over half of the Jones Act West Coast CPP vessel fleet, would distort and obscure the true situation. The failure to disclose the nature of the data used undermines the statistical analysis of the Draft Environmental Analysis.

**Conclusion**

Crowley fully supports the overall aims of the At-Berth regulation to reduce harmful emissions and improve air quality for communities living in the vicinity of California's ports and marine terminals. It is evident and remarkable that the proposed regulation's policy of excluding ATBs is inconsistent with this goal. An environmental analysis that complies with CEQA would make that clear and properly inform the Board to delete the ATB exclusion from the At-Berth Rule. The Draft Environmental Analysis, which violates CEQA, should be amended, or the ATB exclusion removed. Final agency approval of the proposed At-Berth cannot be given until the lawful completion of the required CEQA procedures.

Yours respectfully,  
**CROWLEY MARITIME CORPORATION**
